

# LM5019 100-V, 100-mA Constant On-Time Synchronous Buck Regulator

## 1 Features

- Wide 7.5-V to 100-V Input Range
- Integrated 100-mA High-Side and Low-Side Switches
- No Schottky Required
- Constant On-Time Control
- No Loop Compensation Required
- Ultra-Fast Transient Response
- Nearly Constant Operating Frequency
- Intelligent Peak Current Limit
- Adjustable Output Voltage from 1.225 V
- Precision 2% Feedback Reference
- Frequency Adjustable to 1 MHz
- Adjustable Undervoltage Lockout
- Remote Shutdown
- Thermal Shutdown
- Packages:
  - 8-Pin WSON
  - 8-Pin SO PowerPAD

## 2 Applications

- Smart Power Meters
- Telecommunication Systems
- Automotive Electronics
- Isolated Bias Supply

## 3 Description

The LM5019 is a 100-V, 100-mA synchronous step-down regulator with integrated high-side and low-side MOSFETs. The constant-on-time (COT) control scheme employed in the LM5019 requires no loop compensation, provides excellent transient response, and enables very low step-down ratios. The on-time varies inversely with the input voltage resulting in nearly constant frequency over the input voltage range. A high-voltage startup regulator provides bias power for internal operation of the IC and for integrated gate drivers.

A peak current limit circuit protects against overload conditions. The undervoltage lockout (UVLO) circuit allows the input undervoltage threshold and hysteresis to be independently programmed. Other protection features include thermal shutdown and bias supply undervoltage lockout.

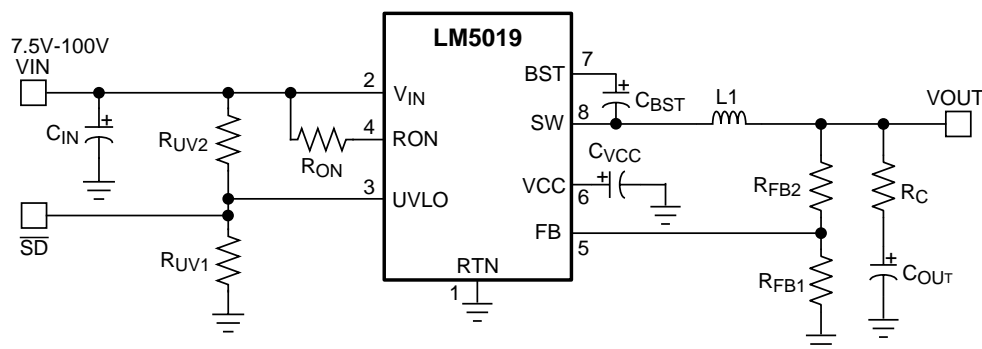

The LM5019 device is available in WSON-8 and SO PowerPAD-8 plastic packages.

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LM5019	SO PowerPAD (8)	4.89 mm x 3.90 mm
	WSON (8)	4.00 mm x 4.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

### Changes from Revision E (December 2013) to Revision F Page

• Added <i>Pin Configuration and Functions</i> section, <i>ESD Rating</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section .....	<b>1</b>
• Added package designators to pin out drawings. ....	<b>3</b>
• Changed <i>Thermal Information</i> table. ....	<b>4</b>
• Added <i>Timing Requirements</i> table. ....	<b>6</b>
• Changed <i>Control Overview</i> section .....	<b>9</b>
• Changed <i>Soft-Start Circuit</i> graphic.....	<b>13</b>
• Changed <i>Series Ripple Resistor <math>R_C</math></i> section to <i>Type III Ripple Circuit</i> .....	<b>15</b>
• Changed <i>Isolated Fly-Buck Converter</i> graphic.....	<b>17</b>

### Changes from Revision D (December 2013) to Revision E Page

• Added Thermal Parameters. ....	<b>4</b>
----------------------------------	----------

### Changes from Revision C (September 2013) to Revision D Page

• Changed Formatting throughout document to the TI standard .....	<b>1</b>
• Changed minimum operating input voltage from 9 V to 7.5 V in <i>Features</i> .....	<b>1</b>
• Changed minimum operating input voltage from 9 V to 7.5 V in <i>Typical Application</i> .....	<b>1</b>
• Changed minimum operating input voltage from 9 V to 7.5 V in <i>Pin Descriptions</i> .....	<b>3</b>
• Added Maximum Junction Temperature.....	<b>4</b>
• Changed minimum operating input voltage from 9 V to 7.5 V in <i>Recommended Operating Conditions</i> . ....	<b>4</b>

### Changes from Revision B (February 2012) to Revision C Page

• Added SW to RTN (100 ns transient) in <i>Absolute Maximum Ratings</i> . ....	<b>4</b>
--	----------

## 5 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION	APPLICATION INFORMATION
NO.	NAME			
1	RTN	—	Ground	Ground connection of the integrated circuit.
2	VIN	I	Input Voltage	Operating input range is 7.5 V to 100 V.
3	UVLO	I	Input Pin of Undervoltage Comparator	Resistor divider from $V_{IN}$ to UVLO to GND programs the undervoltage detection threshold. An internal current source is enabled when UVLO is above 1.225 V to provide hysteresis. When UVLO pin is pulled below 0.66 V externally, the parts goes in shutdown mode.
4	RON	I	On-Time Control	A resistor between this pin and $V_{IN}$ sets the switch on-time as a function of $V_{IN}$ . Minimum recommended on-time is 100 ns at max input voltage.
5	FB	I	Feedback	This pin is connected to the inverting input of the internal regulation comparator. The regulation level is 1.225 V.
6	VCC	O	Output From the Internal High Voltage Series Pass Regulator. Regulated at 7.6 V	The internal VCC regulator provides bias supply for the gate drivers and other internal circuitry. A 1.0- $\mu$ F decoupling capacitor is recommended.
7	BST	I	Bootstrap Capacitor	An external capacitor is required between the BST and SW pins (0.01- $\mu$ F ceramic). The BST pin capacitor is charged by the VCC regulator through an internal diode when the SW pin is low.
8	SW	O	Switching Node	Power switching node. Connect to the output inductor and bootstrap capacitor.
—	EP	—	Exposed Pad	Exposed pad must be connected to RTN pin. Connect to system ground plane on application board for reduced thermal resistance.

## 6 Specifications

### 6.1 Absolute Maximum Ratings<sup>(1)</sup>

	MIN	MAX	UNIT
V <sub>IN</sub> , UVLO to RTN	−0.3	100	V
SW to RTN	−1.5	V <sub>IN</sub> + 0.3	V
SW to RTN (100 ns transient)	−5	V <sub>IN</sub> + 0.3	V
BST to VCC		100	V
BST to SW		13	V
RON to RTN	−0.3	100	V
VCC to RTN	−0.3	13	V
FB to RTN	−0.3	5	V
Lead Temperature <sup>(2)</sup>		200	°C
Maximum Junction Temperature <sup>(3)</sup>		150	°C
Storage temperature, T <sub>stg</sub>	−55	150	°C

- (1) *Absolute Maximum Ratings* are limits beyond which damage to the device may occur. *Recommended Operating Conditions* are conditions under which operation of the device is intended to be functional. For verified specifications and test conditions, see *Electrical Characteristics*. The RTN pin is the GND reference electrically connected to the substrate.
- (2) For detailed information on soldering plastic PowerPAD package, refer to *PowerPAD™ Layout Guidelines (SLOA120)*. Maximum solder time not to exceed 4 seconds.
- (3) High junction temperatures degrade operating lifetimes. Operating lifetime is de-rated for junction temperatures greater than 125°C.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±750	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
V <sub>IN</sub> Voltage	7.5	100	V
Operating Junction Temperature <sup>(2)</sup>	−40	125	°C

- (1) *Recommended Operating Conditions* are conditions under the device is intended to be functional. For specifications and test conditions, see *Electrical Characteristics*.
- (2) High junction temperatures degrade operating lifetimes. Operating lifetime is de-rated for junction temperatures greater than 125°C.

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		LM5019		UNIT
		WSON NGU	SO PowerPAD DDA	
		8 PINS		
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	41.3	41.1	°C/W
R <sub>θJCb</sub>	Junction-to-case (bottom) thermal resistance	3.2	2.4	°C/W
Ψ <sub>JB</sub>	Junction-to-board thermal characteristic parameter	19.2	24.4	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	19.1	30.6	°C/W
R <sub>θJCTop</sub>	Junction-to-case (top) thermal resistance	34.7	37.3	°C/W
Ψ <sub>JT</sub>	Junction-to-top thermal characteristic parameter	0.3	6.7	°C/W

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report (SPRA953).

## 6.5 Electrical Characteristics

Typical values correspond to  $T_J = 25^\circ\text{C}$ . Minimum and maximum limits apply over  $-40^\circ\text{C}$  to  $125^\circ\text{C}$  junction temperature range unless otherwise stated.  $V_{IN} = 48\text{ V}$  unless stated otherwise. See <sup>(1)</sup>.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>V<sub>CC</sub> SUPPLY</b>					
V <sub>CC</sub> Reg V <sub>CC</sub> Regulator Output	$V_{IN} = 48\text{ V}$ , $I_{CC} = 20\text{ mA}$	6.25	7.6	8.55	V
V <sub>CC</sub> Current Limit	$V_{IN} = 48\text{ V}^{(2)}$	26			mA
V <sub>CC</sub> Undervoltage Lockout Voltage (V <sub>CC</sub> Increasing)		4.15	4.5	4.9	V
V <sub>CC</sub> Undervoltage Hysteresis			300		mV
V <sub>CC</sub> Drop Out Voltage	$V_{IN} = 9\text{ V}$ , $I_{CC} = 20\text{ mA}$		2.3		V
I <sub>IN</sub> Operating Current	Non-Switching, FB = 3 V		1.75		mA
I <sub>IN</sub> Shutdown Current	UVLO = 0 V		50	225	μA
<b>SWITCH CHARACTERISTICS</b>					
Buck Switch R <sub>DS(ON)</sub>	$I_{TEST} = 200\text{ mA}$ , BST-SW = 7 V		0.8	1.8	Ω
Synchronous R <sub>DS(ON)</sub>	$I_{TEST} = 200\text{ mA}$		0.45	1	Ω
Gate Drive UVLO	V <sub>BST</sub> – V <sub>SW</sub> Rising	2.4	3	3.6	V
Gate Drive UVLO Hysteresis			260		mV
<b>CURRENT LIMIT</b>					
Current Limit Threshold	$-40^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$	150	240	300	mA
Current Limit Response Time	Time to Switch Off		150		ns
Off-Time Generator (Test 1)	FB = 0.1 V, $V_{IN} = 48\text{ V}$		12		μs
Off-Time Generator (Test 2)	FB = 1 V, $V_{IN} = 48\text{ V}$		2.5		μs
<b>REGULATION AND OVERVOLTAGE COMPARATORS</b>					
FB Regulation Level	Internal Reference Trip Point for Switch ON	1.2	1.225	1.25	V
FB Overvoltage Threshold	Trip Point for Switch OFF		1.62		V
FB Bias Current			60		nA
<b>UNDERVOLTAGE SENSING FUNCTION</b>					
UV Threshold	UV Rising	1.19	1.225	1.26	V
UV Hysteresis Input Current	UV = 2.5 V	–10	–20	–29	μA
Remote Shutdown Threshold	Voltage at UVLO Falling	0.32	0.66		V
Remote Shutdown Hysteresis			110		mV
<b>THERMAL SHUTDOWN</b>					
T <sub>sd</sub> Thermal Shutdown Temperature			165		°C
Thermal Shutdown Hysteresis			20		°C

- (1) All hot and cold limits are specified by correlating the electrical characteristics to process and temperature variations and applying statistical process control.
- (2) V<sub>CC</sub> provides self bias for the internal gate drive and control circuits. Device thermal limitations limit external loading.

## 6.6 Switching Characteristics

Typical values correspond to  $T_J = 25^\circ\text{C}$ . Minimum and maximum limits apply over  $-40^\circ\text{C}$  to  $125^\circ\text{C}$  junction temperature range unless otherwise stated.  $V_{IN} = 48\text{ V}$  unless stated otherwise. See <sup>(1)</sup>.

		MIN	TYP	MAX	UNIT
<b>ON-TIME GENERATOR</b>					
$T_{ON}$ Test 1	$V_{IN} = 32\text{ V}, R_{ON} = 100\text{ k}\Omega$	270	350	460	ns
$T_{ON}$ Test 2	$V_{IN} = 48\text{ V}, R_{ON} = 100\text{ k}\Omega$	188	250	336	ns
$T_{ON}$ Test 3	$V_{IN} = 75\text{ V}, R_{ON} = 100\text{ k}\Omega$	250	370	500	ns
$T_{ON}$ Test 4	$V_{IN} = 10\text{ V}, R_{ON} = 250\text{ k}\Omega$	1880	3200	4425	ns
<b>MINIMUM OFF-TIME</b>					
Minimum Off-Timer	$FB = 0\text{ V}$		144		ns

(1) All hot and cold limits are specified by correlating the electrical characteristics to process and temperature variations and applying statistical process control.

## 7 Detailed Description

### 7.1 Overview

The LM5019 step-down switching regulator features all the functions needed to implement a low cost, efficient, buck converter capable of supplying up to 100 mA to the load. This high-voltage regulator contains 100 V, N-channel buck and synchronous switches, is easy to implement, and is provided in thermally enhanced SO PowerPAD-8 and WSON-8 packages. The regulator operation is based on a constant on-time control scheme using an on-time inversely proportional to  $V_{IN}$ . This control scheme does not require loop compensation. The current limit is implemented with a forced off-time inversely proportional to  $V_{OUT}$ . This scheme ensures short circuit protection while providing minimum foldback.

The LM5019 can be applied in numerous applications to efficiently regulate down higher voltages. This regulator is well suited for 48 V telecom and automotive power bus ranges. Protection features include: thermal shutdown, undervoltage lockout, minimum forced off-time, and an intelligent current limit.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Control Overview

The LM5019 buck regulator employs a control principle based on a comparator and a one-shot on-timer, with the output voltage feedback (FB) compared to an internal reference (1.225 V). If the FB voltage is below the reference the internal buck switch is turned on for the one-shot timer period, which is a function of the input voltage and the programming resistor ( $R_{ON}$ ). Following the on-time the switch remains off until the FB voltage falls below the reference, but never before the minimum off-time forced by the minimum off-time one-shot timer. When the FB pin voltage falls below the reference and the minimum off-time one-shot period expires, the buck switch is turned on for another on-time one-shot period. This will continue until regulation is achieved and the FB voltage is approximately equal to 1.225 V (typ).

In a synchronous buck converter, the low side (sync) FET is 'on' when the high side (buck) FET is 'off'. The inductor current ramps up when the high side switch is 'on' and ramps down when the high side switch is 'off'. There is no diode emulation feature in this IC, and therefore, the inductor current may ramp in the negative direction at light load. This causes the converter to operate in continuous conduction mode (CCM) regardless of the output loading. The operating frequency remains relatively constant with load and line variations. The operating frequency can be calculated as shown in Equation 1.

$$f_{SW} = \frac{V_{OUT1}}{K \times R_{ON}} \quad (1)$$

Where  $K = 9 \times 10^{-11}$

The output voltage ( $V_{OUT}$ ) is set by two external resistors ( $R_{FB1}$ ,  $R_{FB2}$ ). The regulated output voltage is calculated as shown in Equation 2.

$$\frac{R_{FB2}}{R_{FB1}} = \frac{V_{OUT} - 1.225V}{1.225V} \quad (2)$$

This regulator regulates the output voltage based on ripple voltage at the feedback input, requiring a minimum amount of ESR for the output capacitor ( $C_{OUT}$ ). A minimum of 25 mV of ripple voltage at the feedback pin (FB) is required for the LM5019. In cases where the capacitor ESR is too small, additional series resistance may be required ( $R_C$  in Figure 10).

For applications where lower output voltage ripple is required the output can be taken directly from a low ESR output capacitor, as shown in Figure 10. However,  $R_C$  slightly degrades the load regulation.

Figure 10. Low Ripple Output Configuration

### 7.3.2 $V_{CC}$ Regulator

The LM5019 contains an internal high-voltage linear regulator with a nominal output of 7.6 V. The input pin ( $V_{IN}$ ) can be connected directly to the line voltages up to 100 V. The  $V_{CC}$  regulator is internally current limited to 30 mA. The regulator sources current into the external capacitor at  $V_{CC}$ . This regulator supplies current to internal circuit blocks including the synchronous MOSFET driver and the logic circuits. When the voltage on the  $V_{CC}$  pin reaches the undervoltage lockout threshold of 4.5 V, the IC is enabled.

The  $V_{CC}$  regulator contains an internal diode connection to the BST pin to replenish the charge in the gate drive boot capacitor when SW pin is low.

## Feature Description (continued)

At high input voltages, the power dissipated in the high voltage regulator is significant and can limit the overall achievable output power. As an example, with the input at 48 V and switching at high frequency, the  $V_{CC}$  regulator may supply up to 7 mA of current resulting in  $48\text{ V} \times 7\text{ mA} = 336\text{ mW}$  of power dissipation. If the  $V_{CC}$  voltage is driven externally by an alternate voltage source, between 8.55 V and 14 V, the internal regulator is disabled. This reduces the power dissipation in the IC.

### 7.3.3 Regulation Comparator

The feedback voltage at FB is compared to an internal 1.225 V reference. In normal operation, when the output voltage is in regulation, an on-time period is initiated when the voltage at FB falls below 1.225 V. The high side switch will stay on for the on-time, causing the FB voltage to rise above 1.225 V. After the on-time period, the high side switch will stay off until the FB voltage again falls below 1.225 V. During start-up, the FB voltage will be below 1.225 V at the end of each on-time, causing the high side switch to turn on immediately after the minimum forced off-time of 144 ns. The high side switch can be turned off before the on-time is over if the peak current in the inductor reaches the current limit threshold.

### 7.3.4 Overvoltage Comparator

The feedback voltage at FB is compared to an internal 1.62 V reference. If the voltage at FB rises above 1.62 V the on-time pulse is immediately terminated. This condition can occur if the input voltage and/or the output load changes suddenly. The high side switch will not turn on again until the voltage at FB falls below 1.225 V.

### 7.3.5 On-Time Generator

The on-time for the LM5019 is determined by the  $R_{ON}$  resistor, and is inversely proportional to the input voltage ( $V_{IN}$ ), resulting in a nearly constant frequency as  $V_{IN}$  is varied over its range. The on-time equation for the LM5019 is shown in [Equation 3](#).

$$T_{ON} = \frac{10^{-10} \times R_{ON}}{V_{IN}} \quad (3)$$

See [Figure 5](#).  $R_{ON}$  should be selected for a minimum on-time (at maximum  $V_{IN}$ ) greater than 100 ns, for proper operation. This requirement limits the maximum switching frequency for high  $V_{IN}$ .

### 7.3.6 Current Limit

The LM5019 contains an intelligent current limit off-timer. If the current in the buck switch exceeds 240 mA, the present cycle is immediately terminated, and a non-resetable off-timer is initiated. The length of off-time is controlled by the FB voltage and the input voltage  $V_{IN}$ . As an example, when  $FB = 0\text{ V}$  and  $V_{IN} = 48\text{ V}$ , the maximum off-time is set to 16  $\mu\text{s}$ . This condition occurs when the output is shorted, and during the initial part of start-up. This amount of time ensures safe short circuit operation up to the maximum input voltage of 100 V.

In cases of overload where the FB voltage is above zero volts (not a short circuit) the current limit off-time is reduced. Reducing the off-time during less severe overloads reduces the amount of foldback, recovery time, and start-up time. The off-time is calculated from the following equation:

$$T_{OFF(ILIM)} = \frac{0.07 \times V_{IN}}{V_{FB} + 0.2\text{V}} \mu\text{s} \quad (4)$$

The current limit protection feature is peak limited. The maximum average output will be less than the peak.

### 7.3.7 N-Channel Buck Switch and Driver

The LM5019 integrates an N-Channel Buck switch and associated floating high voltage gate driver. The gate driver circuit works in conjunction with an external bootstrap capacitor and an internal high voltage diode. A 0.01- $\mu\text{F}$  ceramic capacitor connected between the BST pin and the SW pin provides the voltage to the driver during the on-time. During each off-time, the SW pin is at approximately 0 V, and the bootstrap capacitor charges from  $V_{CC}$  through the internal diode. The minimum off-timer, set to 144 ns, ensures a minimum time each cycle to recharge the bootstrap capacitor.

## Feature Description (continued)

### 7.3.8 Synchronous Rectifier

The LM5019 provides an internal synchronous N-Channel MOSFET rectifier. This MOSFET provides a path for the inductor current to flow when the high-side MOSFET is turned off.

The synchronous rectifier has no diode emulation mode, and is designed to keep the regulator in continuous conduction mode even during light loads which would otherwise result in discontinuous operation.

### 7.3.9 Undervoltage Detector

The LM5019 contains a dual level Undervoltage Lockout (UVLO) circuit. When the UVLO pin voltage is below 0.66 V, the controller is in a low current shutdown mode. When the UVLO pin voltage is greater than 0.66 V but less than 1.225 V, the controller is in standby mode. In standby mode the  $V_{CC}$  bias regulator is active while the regulator output is disabled. When the  $V_{CC}$  pin exceeds the  $V_{CC}$  undervoltage threshold and the UVLO pin voltage is greater than 1.225 V, normal operation begins. An external set-point voltage divider from  $V_{IN}$  to GND can be used to set the minimum operating voltage of the regulator.

UVLO hysteresis is accomplished with an internal 20- $\mu$ A current source that is switched on or off into the impedance of the set-point divider. When the UVLO threshold is exceeded, the current source is activated to quickly raise the voltage at the UVLO pin. The hysteresis is equal to the value of this current times the resistance  $R_{UV2}$ .

If the UVLO pin is wired directly to the  $V_{IN}$  pin, the regulator will begin operation once the  $V_{CC}$  undervoltage is satisfied.

**Figure 11. UVLO Resistor Setting**

### 7.3.10 Thermal Protection

The LM5019 should be operated so the junction temperature does not exceed 150°C during normal operation. An internal Thermal Shutdown circuit is provided to protect the LM5019 in the event of a higher than normal junction temperature. When activated, typically at 165°C, the controller is forced into a low power reset state, disabling the buck switch and the  $V_{CC}$  regulator. This feature prevents catastrophic failures from accidental device overheating. When the junction temperature reduces below 145°C (typical hysteresis = 20°C), the  $V_{CC}$  regulator is enabled, and normal operation is resumed.

### 7.3.11 Ripple Configuration

LM5019 uses Constant-On-Time (COT) control scheme, in which the on-time is terminated by an on-timer, and the off-time is terminated by the feedback voltage ( $V_{FB}$ ) falling below the reference voltage ( $V_{REF}$ ). Therefore, for stable operation, the feedback voltage must decrease monotonically, in phase with the inductor current during the off-time. Furthermore, this change in feedback voltage ( $V_{FB}$ ) during off-time must be large enough to suppress any noise component present at the feedback node.

Table 1 shows three different methods for generating appropriate voltage ripple at the feedback node. Type 1 and Type 2 ripple circuits couple the ripple at the output of the converter to the feedback node (FB). The output voltage ripple has two components:

1. Capacitive ripple caused by the inductor current ripple charging/discharging the output capacitor.
2. Resistive ripple caused by the inductor current ripple flowing through the ESR of the output capacitor.

## Feature Description (continued)

The capacitive ripple is not in phase with the inductor current. As a result, the capacitive ripple does not decrease monotonically during the off-time. The resistive ripple is in phase with the inductor current and decreases monotonically during the off-time. The resistive ripple must exceed the capacitive ripple at the output node ( $V_{OUT}$ ) for stable operation. If this condition is not satisfied unstable switching behavior is observed in COT converters, with multiple on-time bursts in close succession followed by a long off-time.

Type 3 ripple method uses  $R_r$  and  $C_r$  and the switch node (SW) voltage to generate a triangular ramp. This triangular ramp is ac coupled using  $C_{ac}$  to the feedback node (FB). Since this circuit does not use the output voltage ripple, it is ideally suited for applications where low output voltage ripple is required. See [AN-1481 Controlling Output Ripple and Achieving ESR Independence in Constant On-Time \(COT\) Regulator Designs \(SNVA166\)](#) for more details for each ripple generation method.

**Table 1. Ripple Configuration**

TYPE 1 LOWEST COST CONFIGURATION	TYPE 2 REDUCED RIPPLE CONFIGURATION	TYPE 3 MINIMUM RIPPLE CONFIGURATION
		
$R_C \geq \frac{25 \text{ mV}}{\Delta I_{L(MIN)}} \times \frac{V_{OUT}}{V_{REF}}$	$C \geq \frac{5}{f_{sw} (R_{FB2}    R_{FB1})}$ $R_C \geq \frac{25 \text{ mV}}{\Delta I_{L(MIN)}}$	$C_r = 3300 \text{ pF}$ $C_{ac} = 100 \text{ nF}$ $R_r C_r \leq \frac{(V_{IN(MIN)} - V_{OUT}) \times T_{ON}}{25 \text{ mV}}$

### 7.3.12 Soft-Start

A soft-start feature can be implemented with the LM5019 using an external circuit. As shown in [Figure 12](#), the soft-start circuit consists of one capacitor,  $C_1$ , two resistors,  $R_1$  and  $R_2$ , and a diode, D. During the initial start-up, the VCC voltage is established prior to the  $V_{OUT}$  voltage. Capacitor  $C_1$  is discharged and D is thereby forward biased. The FB voltage exceeds the reference voltage (1.225 V) and switching is therefore disabled. As capacitor  $C_1$  charges, the voltage at node B gradually decreases and switching commences.  $V_{OUT}$  will gradually rise to maintain the FB voltage at the reference voltage. Once the voltage at node B is less than a diode drop above the FB voltage, the soft-start sequence is finished and D is reverse biased.

During the initial part of the start-up, the FB voltage can be approximated as follows. Please note that the effect of  $R_1$  has been ignored to simplify the calculation shown in .

$$V_{FB} = (V_{CC} - V_D) \times \frac{R_{FB1} \times R_{FB2}}{R_2 \times (R_{FB1} + R_{FB2}) + R_{FB1} \times R_{FB2}}$$

$C_1$  is charged after the first start up. Diode D1 is optional and can be added to discharge  $C_1$  and initialize the soft-start sequence when the input voltage experiences a momentary drop.

To achieve the desired soft-start, the following design guidance is recommended:

(1)  $R_2$  is selected so that  $V_{FB}$  is higher than 1.225 V for a  $V_{CC}$  of 4.5 V, but is lower than 5 V when  $V_{CC}$  is 8.55 V. If an external  $V_{CC}$  is used,  $V_{FB}$  should not exceed 5 V at maximum  $V_{CC}$ .

(2)  $C_1$  is selected to achieve the desired start-up time that can be determined as shown in .

$$t_s = C_1 \times (R_2 + \frac{R_{FB1} \times R_{FB2}}{R_{FB1} + R_{FB2}})$$

(3)  $R_1$  is used to maintain the node B voltage at zero after the soft-start is finished. A value larger than the feedback resistor divider is preferred.

With component values from the applications from the schematic shown in Figure 13, selecting  $C_1 = 1\ \mu\text{F}$ ,  $R_2 = 1\ \text{k}\Omega$ ,  $R_1 = 30\ \text{k}\Omega$  results in a soft-start time of about 2 ms.

**Figure 12. Soft-Start Circuit**

## 7.4 Device Functional Modes

The UVLO pin controls the operating mode of the LM5019 device (see Table 2 for the detailed functional states).

**Table 2. UVLO Mode**

UVLO	$V_{CC}$	MODE	DESCRIPTION
$< 0.66\ \text{V}$	Disabled	Shutdown	$V_{CC}$ regulator disabled. Switching disabled.
$0.66\ \text{V}$ to $1.225\ \text{V}$	Enabled	Standby	$V_{CC}$ regulator enabled. Switching disabled.
$> 1.225\ \text{V}$	$V_{CC} < 4.5\ \text{V}$	Standby	$V_{CC}$ regulator enabled. Switching disabled.
	$V_{CC} > 4.5\ \text{V}$	Operating	$V_{CC}$ enabled. Switching enabled.

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The LM5019 device is step-down dc-dc converter. The device is typically used to convert a higher dc voltage to a lower dc voltage with a maximum available output current of 100 mA. Use the following design procedure to select component values for the LM5019 device. Alternately, use the WEBENCH® software to generate a complete design. The WEBENCH software uses an iterative design procedure and accesses a comprehensive database of components when generating a design. This section presents a simplified discussion of the design process.

### 8.2 Typical Application

#### 8.2.1 Application Circuit: 12.5 V to 95 V Input and 10 V, 100-mA Output Buck Converter

The application schematic of a buck supply is shown in Figure 13. For output voltage ( $V_{OUT}$ ) more than one diode drop higher than the maximum regulation threshold of  $V_{CC}$  (8.55 V, see [Electrical Characteristics](#)), the  $V_{CC}$  pin can be connected to  $V_{OUT}$  through a diode (D2), to improve efficiency and reduce power dissipation in the IC.

The design example uses equations from the [Feature Description](#) section with component names provided in the [Typical Application](#) schematic. Corresponding component designators from Figure 13 are also provided for each selected value.

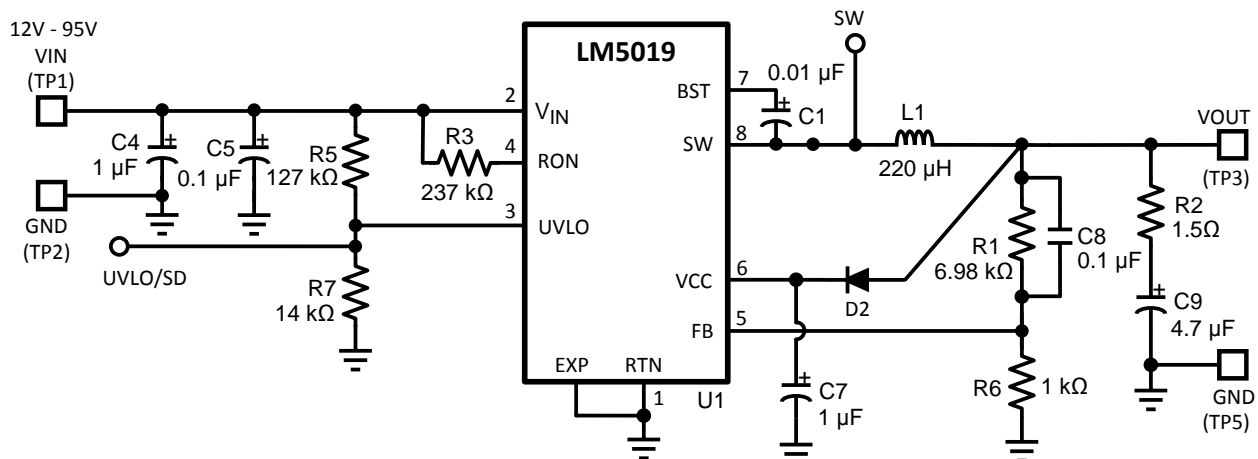

Figure 13. 12.5 V to 95 V Input and 10 V, 100 mA Output Buck Converter

#### 8.2.1.1 Design Requirements

DESIGN PARAMETERS	VALUE
Input Range	12.5 V to 95 V, transients up to 100 V
Output Voltage	10 V
Maximum Output Current	100 mA
Nominal Switching Frequency	≈ 440 kHz

### 8.2.1.2 Detailed Design Procedure

#### 8.2.1.2.1 RFB1, RFB2

$V_{OUT} = V_{FB} \times (R_{FB2} / R_{FB1} + 1)$ , and since  $V_{FB} = 1.225$  V, the ratio of  $R_{FB2}$  to  $R_{FB1}$  calculates to be 7:1. Standard values are chosen with  $R_{FB2} = R1 = 6.98$  k $\Omega$  and  $R_{FB1} = R6 = 1.00$  k $\Omega$  are chosen. Other values could be used as long as the 7:1 ratio is maintained.

#### 8.2.1.2.2 Frequency Selection

At the minimum input voltage, the maximum switching frequency of LM5019 is restricted by the forced minimum off-time ( $T_{OFF(MIN)}$ ) as given by [Equation 5](#).

$$f_{SW(MAX)} = \frac{1 - D_{MAX}}{T_{OFF(MIN)}} = \frac{1 - 10/12.5}{200 \text{ ns}} = 1 \text{ MHz} \quad (5)$$

Similarly, at maximum input voltage, the maximum switching frequency of LM5019 is restricted by the minimum  $T_{ON}$  as given by [Equation 6](#).

$$f_{SW(MAX)} = \frac{D_{MIN}}{T_{ON(MIN)}} = \frac{10/48}{100 \text{ ns}} = 2.1 \text{ MHz} \quad (6)$$

Resistor  $R_{ON}$  sets the nominal switching frequency based on [Equation 7](#).

$$f_{SW} = \frac{V_{OUT}}{K \times R_{ON}} \quad (7)$$

Where:

$$K = 9 \times 10^{-11}$$

Operation at high switching frequency results in lower efficiency while providing the smallest solution. For this example 440 kHz was selected, resulting in  $R_{ON} = 253$  k $\Omega$ . A standard value for  $R_{ON} = R3 = 237$  k $\Omega$  is selected.

#### 8.2.1.2.3 Inductor Selection

The inductance selection is a compromise between solution size, output ripple, and efficiency. The peak inductor current at maximum load current should be smaller than the minimum current limit threshold of 150 mA. The maximum permissible peak to peak inductor ripple is determined by [Equation 8](#).

$$\Delta I_L = 2 \times (I_{LIM(min)} - I_{OUT(max)}) = 2 \times 50 = 100 \text{ mA} \quad (8)$$

The minimum inductance is determined by [Equation 9](#).

$$\Delta I_L = \frac{V_{IN} - V_{OUT}}{L \times f_{SW}} \times \frac{V_{OUT}}{V_{IN}} \quad (9)$$

Using maximum  $V_{IN}$  of 95 V, the calculation from [Equation 9](#) results in  $L = 203$   $\mu$ H. A standard value of 220  $\mu$ H is selected. With this value of inductance, peak-to-peak minimum and maximum inductor current ripple of 27 mA and 92 mA occur at the minimum and maximum input voltages, respectively. For robust short circuit protection, the inductor saturation current should be higher than the maximum current limit threshold of 300 mA.

#### 8.2.1.2.4 Output Capacitor

The output capacitor is selected to minimize the capacitive ripple across it. The maximum ripple is observed at maximum input voltage and is given by [Equation 10](#).

$$C_{OUT} = \frac{\Delta I_L}{8 \times f_{SW} \times \Delta V_{ripple}} \quad (10)$$

Where:

$\Delta V_{ripple}$  is the voltage ripple across the capacitor and  $\Delta I_L$  is the inductor ripple current.

Assuming  $V_{IN} = 95$  V and substituting  $\Delta V_{ripple} = 10$  mV gives  $C_{OUT} = 2.6$   $\mu$ F. A 4.7- $\mu$ F standard value is selected for  $C_{OUT} = C9$ . An X5R or X7R type capacitor with a voltage rating 16 V or higher should be selected.

#### 8.2.1.2.5 Type II Ripple Circuit

Type II ripple circuit as described in [Ripple Configuration](#) is chosen for this example. For a constant on time converter to be stable, the injected in-phase ripple should be larger than the capacitive ripple on  $C_{OUT}$ .

Using type II ripple circuit equations with minimum FB pin ripple of 25 mV, the values of the series resistor  $R_C$  and ac coupling capacitor  $C_{ac}$  can be calculated.

$$C \geq \frac{5}{f_{sw} (R_{FB2} || R_{FB1})}$$

$$R_C \geq \frac{25 \text{ mV}}{\Delta I_{L(MIN)}} \quad (11)$$

Assuming  $R_{FB2} = 6.98 \text{ k}\Omega$  and  $R_{FB1} = 1 \text{ k}\Omega$ , the calculated minimum value of  $C_{ac}$  is  $0.013 \text{ }\mu\text{F}$ . A standard value of  $0.1 \text{ }\mu\text{F}$  is selected for  $C_{ac} = C8$ . The value of the series output resistor  $R_C$  is calculated for the minimum input voltage condition when the inductor ripple current is at a minimum. Using Equation 9 and assuming  $V_{IN} = 12.5 \text{ V}$ , the minimum inductor ripple current is  $27 \text{ mA}$ . The calculated minimum value of  $R_C$  is  $0.93 \text{ }\Omega$ . A standard value of  $1.5 \text{ }\Omega$  is selected for  $R_C = R2$  to provide additional ripple for stable switching at low  $V_{IN}$ .

#### 8.2.1.2.6 $V_{CC}$ and Bootstrap Capacitor

The  $V_{CC}$  capacitor provides charge to bootstrap capacitor as well as internal circuitry and low side gate driver. The bootstrap capacitor provides charge to high side gate driver. The recommended value for  $C_{VCC} = C7$  is  $1 \text{ }\mu\text{F}$ . A good value for  $C_{BST} = C1$  is  $0.01 \text{ }\mu\text{F}$ .

#### 8.2.1.2.7 Input Capacitor

Input capacitor should be large enough to limit the input voltage ripple shown in Equation 12.

$$C_{IN} \geq \frac{I_{OUT(MAX)}}{8 \times f_{sw} \times \Delta V_{IN}} \quad (12)$$

Choosing a  $\Delta V_{IN} = 0.5 \text{ V}$  gives a minimum  $C_{IN} = 0.06 \text{ }\mu\text{F}$ . A standard value of  $1.0 \text{ }\mu\text{F}$  is selected for  $C_{IN} = C4$ . The input capacitor should be rated for the maximum input voltage under all conditions. A 50-V, X7R dielectric should be selected for this design.

Input capacitor should be placed directly across  $V_{IN}$  and RTN (pin 2 and 1) of the IC. If it is not possible to place all of the input capacitor close to the IC, a  $0.1\text{-}\mu\text{F}$  capacitor should be placed near the IC to provide a bypass path for the high frequency component of the switching current. This helps limit the switching noise.

#### 8.2.1.2.8 UVLO

The UVLO resistors  $R_{UV1}$  and  $R_{UV2}$  set the UVLO threshold and hysteresis according to Equation 13 and Equation 14.

$$V_{IN(HYS)} = I_{HYS} \times R_{UV2} \quad (13)$$

$$V_{IN(UVLO, rising)} = 1.225 \text{ V} \times \left( \frac{R_{UV2}}{R_{UV1}} + 1 \right) \quad (14)$$

Where  $I_{HYS} = 20 \text{ }\mu\text{A}$ . For UVLO hysteresis of  $2.5 \text{ V}$  and UVLO rising threshold of  $12 \text{ V}$  the calculated values of the UVLO resistors are  $R_{UV2} = 127 \text{ k}\Omega$  and  $R_{UV1} = 14.5 \text{ k}\Omega$ . Selecting standard values for  $R_{UV1} = R7 = 14 \text{ k}\Omega$  and  $R_{UV2} = R5 = 127 \text{ k}\Omega$  results in UVLO rising threshold of  $12.5 \text{ V}$  and hysteresis of  $2.5 \text{ V}$ .

### 8.2.1.3 Application Curves

Figure 14. Efficiency vs Load Current

Figure 15. Frequency vs Input Voltage

Figure 16. Typical Switching Waveform ( $V_{IN} = 48\text{ V}$ ,  $I_{OUT} = 100\text{ mA}$ )

### 8.2.2 Application Circuit: 20 V to 95 V Input and 10 V, 100 mA Output Isolated Fly-Buck™ Converter

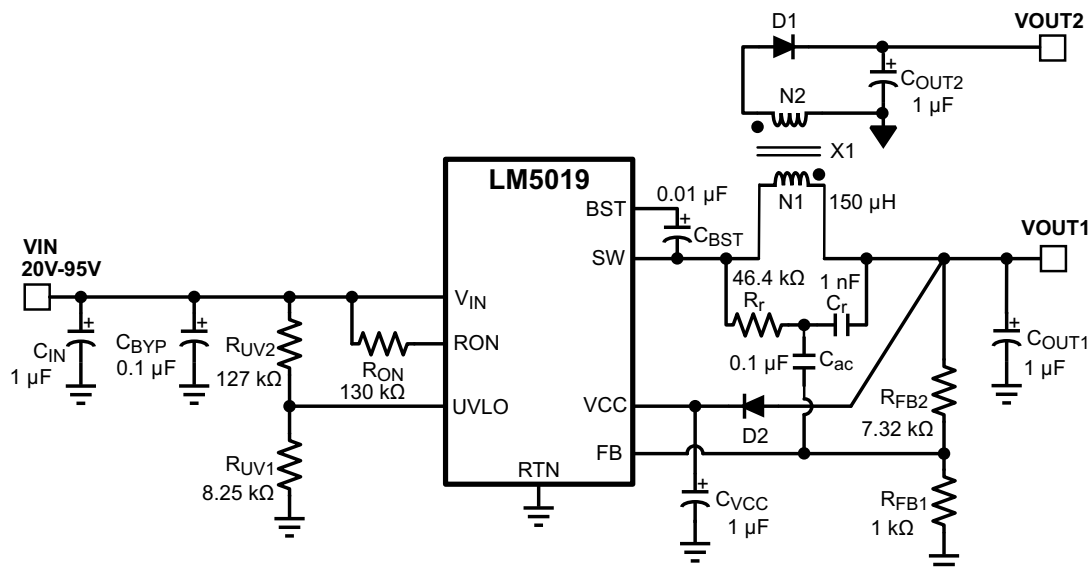

Figure 17. Isolated Fly-Buck Converter Using LM5019

### 8.2.2.1 Design Requirements

Selection of external components is illustrated through a design example. The design example specifications are shown in [Table 3](#).

**Table 3. Buck Converter Design Specifications**

DESIGN PARAMETERS	VALUE
Input Voltage Range	20 V to 95 V
Primary Output Voltage	10 V
Secondary (Isolated) Output Voltage	9.5 V
Maximum Output Current (Primary + Secondary)	100 mA
Maximum Power Output	1 W
Nominal Switching Frequency	750 kHz

### 8.2.2.2 Detailed Design Procedure

#### 8.2.2.2.1 Transformer Turns Ratio

The transformer turns ratio is selected based on the ratio of the primary output voltage to the secondary (isolated) output voltage. In this design example, the two outputs are nearly equal and a 1:1 turns ratio transformer is selected. Therefore,  $N_2 / N_1 = 1$ .

If the secondary (isolated) output voltage is significantly higher or lower than the primary output voltage, a turns ratio less than or greater than 1 is recommended. The primary output voltage is normally selected based on the input voltage range such that the duty cycle of the converter does not exceed 50% at the minimum input voltage. This condition is satisfied if  $V_{OUT1} < V_{IN\_MIN} / 2$ .

#### 8.2.2.2.2 Total IOUT

The total primary referred load current is calculated by multiplying the isolated output load(s) by the turns ratio of the transformer as shown in [Equation 15](#).

$$I_{OUT(MAX)} = I_{OUT1} + I_{OUT2} \times \frac{N_2}{N_1} = 0.1 \text{ A} \quad (15)$$

#### 8.2.2.2.3 RFB1, RFB2

The feedback resistors are selected to set the primary output voltage. The selected value for  $R_{FB1}$  is 1 k $\Omega$ .  $R_{FB2}$  can be calculated using the following equations to set  $V_{OUT1}$  to the specified value of 10 V. A standard resistor value of 7.32 k $\Omega$  is selected for  $R_{FB2}$ .

$$V_{OUT1} = 1.225 \text{ V} \times \left(1 + \frac{R_{FB2}}{R_{FB1}}\right) \quad (16)$$

$$\rightarrow R_{FB2} = \left(\frac{V_{OUT1}}{1.225} - 1\right) \times R_{FB1} = 7.16 \text{ k}\Omega \quad (17)$$

#### 8.2.2.2.4 Frequency Selection

[Equation 18](#) is used to calculate the value of  $R_{ON}$  required to achieve the desired switching frequency.

$$f_{SW} = \frac{V_{OUT1}}{K \times R_{ON}} \quad (18)$$

Where  $K = 9 \times 10^{-11}$

For  $V_{OUT1}$  of 10 V and  $f_{SW}$  of 750 kHz, the calculated value of  $R_{ON}$  is 148 k $\Omega$ . A lower value of 130 k $\Omega$  is selected for this design to allow for second order effects at high switching frequency that are not included in [Equation 1](#).

#### 8.2.2.2.5 Transformer Selection

A coupled inductor or a flyback-type transformer is required for this topology. Energy is transferred from primary to secondary when the low-side synchronous switch of the buck converter is conducting.

The maximum inductor primary ripple current that can be tolerated without exceeding the buck switch peak current limit threshold (0.15 A minimum) is given by [Equation 19](#).

$$\Delta I_{L1} = \left( 0.15 - I_{OUT1} - I_{OUT2} \times \frac{N2}{N1} \right) \times 2 = 0.1 \text{ A} \quad (19)$$

Using the maximum peak-to-peak inductor ripple current  $\Delta I_{L1}$  from Equation 19, the minimum inductor value is given by Equation 20.

$$L1 = \frac{V_{IN(MAX)} - V_{OUT}}{\Delta I_{L1} \times f_{SW}} \times \frac{V_{OUT}}{V_{IN(MAX)}} = 119.3 \mu\text{H} \quad (20)$$

A higher value of 150  $\mu\text{H}$  is selected to insure the high-side switch current does not exceed the minimum peak current limit threshold.

#### 8.2.2.2.6 Primary Output Capacitor

In a conventional buck converter the output ripple voltage is calculated as shown in Equation 21.

$$\Delta V_{OUT} = \frac{\Delta I_{L1}}{8 \times f \times C_{OUT1}} \quad (21)$$

To limit the primary output ripple voltage  $\Delta V_{OUT1}$  to approximately 50 mV, an output capacitor  $C_{OUT1}$  of 0.33  $\mu\text{F}$  is required.

Figure 18 shows the primary winding current waveform ( $I_{L1}$ ) of a Fly-Buck converter. The reflected secondary winding current adds to the primary winding current during the buck switch off-time. Because of this increased current, the output voltage ripple is not the same as in conventional buck converter. The output capacitor value calculated in Equation 21 should be used as the starting point. Optimization of output capacitance over the entire line and load range must be done experimentally. If the majority of the load current is drawn from the secondary isolated output, a better approximation of the primary output voltage ripple is given by Equation 22.

$$\Delta V_{OUT1} = \frac{\left( I_{OUT2} \times \frac{N2}{N1} \right) \times T_{ON(MAX)}}{C_{OUT1}} \approx 67 \text{ mV} \quad (22)$$

**Figure 18. Current Waveforms for  $C_{OUT1}$  Ripple Calculation**

A standard 1- $\mu\text{F}$ , 25 V capacitor is selected for this design. If lower output voltage ripple is required, a higher value should be selected for  $C_{OUT1}$  and/or  $C_{OUT2}$ .

#### 8.2.2.2.7 Secondary Output Capacitor

A simplified waveform for secondary output current ( $I_{OUT2}$ ) is shown in Figure 19.

**Figure 19. Secondary Current Waveforms for  $C_{OUT2}$  Ripple Calculation**

The secondary output current ( $I_{OUT2}$ ) is sourced by  $C_{OUT2}$  during on-time of the buck switch,  $T_{ON}$ . Ignoring the current transition times in the secondary winding, the secondary output capacitor ripple voltage can be calculated using Equation 23.

$$\Delta V_{OUT2} = \frac{I_{OUT2} \times T_{ON (MAX)}}{C_{OUT2}} \quad (23)$$

For a 1:1 transformer turns ratio, the primary and secondary voltage ripple equations are identical. Therefore,  $C_{OUT2}$  is chosen to be equal to  $C_{OUT1}$  (1  $\mu$ F) to achieve comparable ripple voltages on primary and secondary outputs.

If lower output voltage ripple is required, a higher value should be selected for  $C_{OUT1}$  and/or  $C_{OUT2}$ .

#### 8.2.2.2.8 Type III Feedback Ripple Circuit

Type III ripple circuit as described in [Ripple Configuration](#) is required for the Fly-Buck topology. Type I and Type II ripple circuits use series resistance and the triangular inductor ripple current to generate ripple at  $V_{OUT}$  and the FB pin. The primary ripple current of a Fly-Buck is the combination of primary and reflected secondary currents as illustrated in [Figure 18](#). In the Fly-Buck topology, Type I and Type II ripple circuits suffer from large jitter as the reflected load current affects the feedback ripple.

**Figure 20. Type III Ripple Circuit**

Selecting the Type III ripple components using the equations from [Ripple Configuration](#) will guarantee that the FB pin ripple is greater than the capacitive ripple from the primary output capacitor  $C_{OUT1}$ . The feedback ripple component values are chosen as shown in Equation 24.

$$\begin{aligned} C_r &= 1000 \text{ pF} \\ C_{ac} &= 0.1 \text{ } \mu\text{F} \\ R_r C_r &\leq \frac{(V_{IN (MIN)} - V_{OUT}) \times T_{ON}}{50 \text{ mV}} \end{aligned} \quad (24)$$

The calculated value for  $R_r$  is 66 k $\Omega$ . This value provides the minimum ripple for stable operation. A smaller resistance should be selected to allow for variations in  $T_{ON}$ ,  $C_{OUT1}$  and other components. For this design,  $R_r$  value of 46.4 k $\Omega$  is selected.

#### 8.2.2.2.9 Secondary Diode

The reverse voltage across secondary-rectifier diode D1 when the high-side buck switch is off can be calculated using Equation 25.

$$V_{D1} = \frac{N2}{N1} V_{IN} \quad (25)$$

For a  $V_{IN\_MAX}$  of 95 V and the 1:1 turns ratio of this design, a 100 V Schottky is selected.

#### 8.2.2.2.10 $V_{CC}$ and Bootstrap Capacitor

A 1- $\mu$ F capacitor of 16 V or higher rating is recommended for the  $V_{CC}$  regulator bypass capacitor.

A good value for the BST pin bootstrap capacitor is 0.01- $\mu$ F with a 16 V or higher rating.

### 8.2.2.2.11 Input Capacitor

The input capacitor is typically a combination of a smaller bypass capacitor located near the regulator IC and a larger bulk capacitor. The total input capacitance should be large enough to limit the input voltage ripple to a desired amplitude. For input ripple voltage  $\Delta V_{IN}$ ,  $C_{IN}$  can be calculated using Equation 26.

$$C_{IN} \geq \frac{I_{OUT(MAX)}}{4 \times f \times \Delta V_{IN}} \quad (26)$$

Choosing a  $\Delta V_{IN}$  of 0.5 V gives a minimum  $C_{IN}$  of 0.067  $\mu F$ . A standard value of 0.1  $\mu F$  is selected for  $C_{BYP}$  in this design. A bulk capacitor of higher value reduces voltage spikes due to parasitic inductance between the power source to the converter. A standard value of 1  $\mu F$  is selected for  $C_{IN}$  in this design. The voltage ratings of the two input capacitors should be greater than the maximum input voltage under all conditions.

### 8.2.2.2.12 UVLO Resistors

UVLO resistors  $R_{UV1}$  and  $R_{UV2}$  set the undervoltage lockout threshold and hysteresis according to Equation 27 and Equation 28.

$$V_{IN(HYS)} = I_{HYS} \times R_{UV2} \quad (27)$$

$$V_{IN(UVLO, \text{rising})} = 1.225V \times \left( \frac{R_{UV2}}{R_{UV1}} + 1 \right) \quad (28)$$

Where  $I_{HYS} = 20 \mu A$ , typical.

For a UVLO hysteresis of 2.5 V and UVLO rising threshold of 20 V, Equation 27 and Equation 28 require  $R_{UV1}$  of 8.25 k $\Omega$  and  $R_{UV2}$  of 127 k $\Omega$  and these values are selected for this design example.

### 8.2.2.2.13 $V_{CC}$ Diode

Diode D2 is an optional diode connected between  $V_{OUT1}$  and the  $V_{CC}$  regulator output pin. When  $V_{OUT1}$  is more than one diode drop greater than the  $V_{CC}$  voltage, the  $V_{CC}$  bias current is supplied from  $V_{OUT1}$ . This results in reduced power losses in the internal  $V_{CC}$  regulator which improves converter efficiency.  $V_{OUT1}$  must be set to a voltage at least one diode drop higher than 8.55 V (the maximum  $V_{CC}$  voltage) if D2 is used to supply bias current.

## 8.2.2.3 Application Curves

Figure 21. Efficiency at 750 kHz,  $V_{OUT1} = 10 V$

Figure 22. Steady State Waveform

## 9 Power Supply Recommendations

LM5019 is a power management device. The power supply for the device is any DC voltage source within the specified input range.

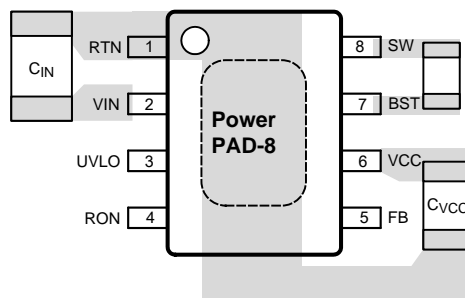

## 10 Layout

### 10.1 Layout Guidelines

A proper layout is essential for optimum performance of the circuit. In particular, the following guidelines should be observed:

1.  $C_{IN}$ : The loop consisting of input capacitor ( $C_{IN}$ ),  $V_{IN}$  pin, and RTN pin carries switching currents. Therefore, the input capacitor should be placed close to the IC, directly across  $V_{IN}$  and RTN pins and the connections to these two pins should be direct to minimize the loop area. In general it is not possible to accommodate all of input capacitance near the IC. A good practice is to use a 0.1- $\mu$ F or 0.47- $\mu$ F capacitor directly across the  $V_{IN}$  and RTN pins close to the IC, and the remaining bulk capacitor as close as possible (see Figure 23).
2.  $C_{VCC}$  and  $C_{BST}$ : The  $V_{CC}$  and bootstrap (BST) bypass capacitors supply switching currents to the high and low side gate drivers. These two capacitors should also be placed as close to the IC as possible, and the connecting trace length and loop area should be minimized (see Figure 23).
3. The Feedback trace carries the output voltage information and a small ripple component that is necessary for proper operation of LM5019. Therefore, care should be taken while routing the feedback trace to avoid coupling any noise to this pin. In particular, feedback trace should not run close to magnetic components, or parallel to any other switching trace.
4. SW trace: The SW node switches rapidly between  $V_{IN}$  and GND every cycle and is therefore a possible source of noise. The SW node area should be minimized. In particular, the SW node should not be inadvertently connected to a copper plane or pour.

### 10.2 Layout Example

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
