

MAXIM

670MHz LVDS-to-LVDS and Anything-to-LVDS 2:1 Multiplexers

General Description

The MAX9176/MAX9177 are 670MHz, low-jitter, low-skew 2:1 multiplexers ideal for protection switching, loopback, and clock distribution. The devices feature ultra-low 68ps peak-to-peak deterministic jitter that ensures reliable operation in high-speed links that are highly sensitive to timing errors.

The MAX9176 has fail-safe LVDS inputs and an LVDS output. The MAX9177 has “anything” differential inputs (CML/LVDS/LVPECL) and an LVDS output. The output can be put into high impedance using the power-down input. The MAX9176 features fail-safe circuits that drive the output high when a selected input is open, undriven and shorted, or undriven and terminated. The MAX9177 has bias circuits that force the output high when a selected input is open. The mux select and power-down inputs are compatible with standard LVTTTL/LVCMOS logic.

The select and power-down inputs tolerate undershoot of -1V and overshoot of $V_{CC} + 1V$. The MAX9176/MAX9177 are available in 10-pin μ MAX and 10-lead thin QFN packages, and operate from a single 3.3V supply over the -40°C to +85°C temperature range.

Applications

Protection Switching
Loopback
Clock Distribution

Functional Diagram appears at end of data sheet.

Features

- ◆ 1.0ps(RMS) Jitter (max) at 670MHz
- ◆ 68ps(P-P) Jitter at 800Mbps Data Rate
- ◆ 3.3V Supply
- ◆ LVDS Fail-Safe Inputs (MAX9176)
- ◆ Anything Inputs (MAX9177) Accept CML/LVDS/LVPECL
- ◆ Select and Power-Down Inputs Tolerate -1.0V and $V_{CC} + 1.0V$
- ◆ Low-Power CMOS Design
- ◆ 10-Lead μ MAX and QFN Packages
- ◆ -40°C to +85°C Operating Temperature Range
- ◆ Conform to ANSI TIA/EIA-644 LVDS Standard
- ◆ IEC61000-4-2 Level 4 ESD Rating

Ordering Information

| PART | TEMP RANGE | PIN-PACKAGE |
|-------------|----------------|------------------|
| MAX9176EUB | -40°C to +85°C | 10 μ MAX |
| MAX9176ETB* | -40°C to +85°C | 10 Thin QFN-EP** |
| MAX9177EUB | -40°C to +85°C | 10 μ MAX |
| MAX9177ETB* | -40°C to +85°C | 10 Thin QFN-EP** |

670MHz LVDS-to-LVDS and Anything-to-LVDS 2:1 Multiplexers

ABSOLUTE MAXIMUM RATINGS

| | |
|---|-----------------------------------|
| V _{CC} to GND | -0.3V to +4.0V |
| IN ₊ , IN ₋ to GND | -0.3V to +4.0V |
| OUT ₊ , OUT ₋ to GND | -0.3V to +4.0V |
| PD, SEL to GND | -1.4V to (V _{CC} + 1.4V) |
| Single-Ended and Differential Output | |
| Short-Circuit Duration (OUT ₊ , OUT ₋) | Continuous |
| Continuous Power Dissipation (T _A = +70°C) | |
| 10-Pin μMAX (derate 5.6mW/°C above +70°C) | 444mW |
| 10-Lead Thin QFN (derate 24.4mW/°C above +70°C) | 1951mW |

| | |
|--|-----------------|
| Operating Temperature Range | -40°C to +85°C |
| Maximum Junction Temperature | +150°C |
| Storage Temperature Range | -65°C to +150°C |
| ESD Protection | |
| Human Body Model (R _D = 1.5kΩ, C _S = 100pF) | |
| (IN ₊ , IN ₋ , OUT ₊ , OUT ₋) | ±16kV |
| IEC61000-4-2 Level 4 (R _D = 330Ω, C _S = 150pF) | |
| Contact Discharge (IN ₊ , IN ₋ , OUT ₊ , OUT ₋) | ±8 kV |
| Air-Gap Discharge (IN ₊ , IN ₋ , OUT ₊ , OUT ₋) | ±15kV |
| Lead Temperature (soldering, 10s) | +300°C |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

(V_{CC} = 3.0V to 3.6V, R_L = 100Ω, \overline{PD} = high, SEL = high or low, differential input voltage |V_{ID}| = 0.05V to 1.2V, MAX9176 input common-mode voltage V_{CM} = |V_{ID}|/2l to 2.4V - |V_{ID}|/2l, MAX9177 input common-mode voltage V_{CM} = |V_{ID}|/2l to V_{CC} - |V_{ID}|/2l, T_A = -40°C to +85°C, unless otherwise noted. Typical values are at V_{CC} = 3.3V, |V_{ID}| = 0.2V, V_{CM} = 1.25V, T_A = +25°C.) (Notes 1, 2, 3)

| Maximum Data Rate | DR _{MAX} | Figures 4, 5, $ V_{OD} \geq 250mV$ (Note 11) | 800 | | | Mbps |
| Maximum Switching Frequency | f _{MAX} | Figures 4, 5, $ V_{OD} \geq 250mV$ (Note 11) | 670 | | | MHz |
| Switching Supply Current | I _{CCSW} | f _{IN} = 670MHz | | 38 | 58 | mA |
| | | f _{IN} = 155MHz | | 26 | 47 | |
| PRBS Supply Current | I _{CCPR} | DR = 800Mbps, 2 ²³ - 1 PRBS input | | 27 | 49 | mA |

Note 1: Current into a pin is defined as positive. Current out of a pin is defined as negative. All voltages are referenced to ground except V_{TH} , V_{TL} , V_{ID} , V_{OD} , and ΔV_{OD} .

Note 2: Maximum and minimum limits over temperature are guaranteed by design and characterization. Devices are 100% tested at $T_A = +25^\circ C$.

Note 3: Tolerance on all external resistors (including figures) is $\pm 1\%$.

Note 4: Guaranteed by design and characterization.

Note 5: AC parameters are guaranteed by design and characterization and not production tested. Limits are set at ± 6 sigma.

Note 6: C_L includes scope probe and test jig capacitance.

Note 7: Pulse-generator output for differential inputs IN₊, IN₋ (unless otherwise noted): $f = 670MHz$, 50% duty cycle, $R_O = 50\Omega$, $t_R = 500ps$, and $t_F = 500ps$ (0% to 100%). Pulse-generator output for single-ended inputs PD, SEL: $t_R = t_F = 1.5ns$ (0.2V_{CC} to 0.8V_{CC}), 50% duty cycle, $V_{OH} = V_{CC} + 1.0V$ settling to V_{CC} , $V_{OL} = -1.0V$ settling to zero.

Note 8: Pulse-generator output for t_{DJ}: $V_{OD} = 0.15V$, $V_{OS} = 1.25V$, bit rate = 800Mbps, 2²³ - 1 PRBS, $R_O = 50\Omega$, $t_R = 500ps$, and $t_F = 500ps$ (0% to 100%).

Note 9: t_{SKPP1} is the magnitude of the difference of any differential propagation delays between devices operating under identical conditions.

Note 10: t_{SKPP2} is the magnitude of the difference of any differential propagation delays between devices operating over rated conditions.

Note 11: Meets all AC specifications.

Note 12: Input jitter subtracted from output jitter.

| MAX9177 | Open | H |
| MAX9176 | Open, undriven short, or undriven parallel termination | |

Detailed Description

The MAX9176/MAX9177 are 670MHz, low-jitter, low-skew 2:1 multiplexers ideal for protection switching, loopback, and clock distribution. The devices feature ultra-low 68ps(p-p) deterministic jitter that ensures reliable operation in high-speed links that are highly sensitive to timing error.

The MAX9176 has fail-safe LVDS inputs and an LVDS output. The MAX9177 has anything differential inputs (CML/LVDS/LVPECL) and an LVDS output. The output can be put into high impedance using the power-down input. The MAX9176 features fail-safe circuits that drive the output high when a selected input is open, undriven and shorted, or undriven and terminated. The MAX9177 has bias circuits that force the output high when a selected input is open. The mux select and power-down inputs are compatible with standard LVTTTL/LVCMOS logic.

The select and power-down inputs tolerate undershoot of -1V and overshoot of V_{CC} + 1V. The MAX9176/MAX9177 are available in 10-pin μMAX and 10-lead thin QFN packages, and operate from a single 3.3V supply over the -40°C to +85°C temperature range.

Current-Mode LVDS Output

The LVDS output uses a current-steering configuration. This approach results in less ground bounce and less output ringing, enhancing noise margin and system speed performance.

A differential output voltage is produced by steering current through the parallel combination of the integrated differential output resistor and transmission line impedance/termination resistor. When driving a 100Ω load, a differential voltage of 250mV to 475mV is produced. For loads greater than 100Ω, the output voltage is larger, and for loads less than 100Ω, the output volt-

Table 2. Input Select and Power-Down Function Table

| SEL | $\overline{\text{PD}}$ | OUT ₊ , OUT ₋ |
|-----------|------------------------|--|
| H | H | IN1 ₊ , IN1 ₋ |
| L or open | H | IN0 ₊ , IN0 ₋ |
| X | L or open | High impedance to ground and 123Ω (typ) differential output resistance |

age is smaller. See the Differential Output Voltage vs. Load Resistance curve in *Typical Operating Characteristics* for more information. The output is short-circuit current limited for single-ended and differential shorts.

MAX9176 Input Fail-Safe

The fail-safe feature of the MAX9176 sets the output high when the differential input is:

- Open
- Undriven and shorted
- Undriven and terminated

Without a fail-safe circuit, when the selected input is undriven, noise at the input may switch the output and it may appear to the system that data is being sent. Open or undriven terminated input conditions can occur when a cable is disconnected or cut, or when the driver output is in high impedance. A shorted input can occur because of a cable failure.

When the selected input is driven with a differential signal of |V_{ID}| = 50mV to 1.2V within a voltage range of 0 to 2.4V, the fail-safe circuit is not activated. If the selected input is open, undriven and shorted, or undriven and terminated, an internal resistor in the fail-safe circuit pulls both inputs above V_{CC} - 0.3V, activating the fail-safe circuit and forcing the output high (Figure 1).

Overshoot and Undershoot Voltage Protection

The MAX9176/MAX9177 are designed to protect the select and power-down inputs (SEL and $\overline{\text{PD}}$) against latchup due to transient overshoot and undershoot voltage. If the input voltage goes above V_{CC} or below GND by up to 1V, an internal circuit limits input current to 1.5mA.

670MHz LVDS-to-LVDS and Anything-to-LVDS 2:1 Multiplexers

Applications Information

Power-Supply Bypassing

Bypass the V_{CC} pin with high-frequency surface-mount ceramic $0.1\mu\text{F}$ and $0.001\mu\text{F}$ capacitors in parallel as close to the device as possible, with the smaller valued capacitor closest to V_{CC} .

Differential Traces

Input and output trace characteristics affect the performance of the MAX9176/MAX9177. Use controlled-impedance differential traces (100Ω typical). To reduce radiated noise and ensure that noise couples as common mode, route the differential input and output signals within a pair close together. Reduce skew by matching the electrical length of the two signal paths that make up the differential pair. Excessive skew can result in a degradation of magnetic field cancellation. Maintain a constant distance between the differential traces to avoid discontinuities in differential impedance. Minimize the number of vias to further prevent impedance discontinuities.

Cables and Connectors

Interconnect for LVDS typically has a controlled differential impedance of 100Ω . Use cables and connectors that have matched differential impedance to minimize impedance discontinuities.

Avoid the use of unbalanced cables such as ribbon or simple coaxial cable. Balanced cables such as twisted pair offer superior signal quality and tend to generate less EMI due to magnetic field canceling effects. Balanced cables pick up noise as common mode, which is rejected by the LVDS receiver.

Termination

The MAX9176/MAX9177 require external input and output termination resistors. For LVDS, connect an input termination resistor across each differential input and at the far end of the interconnect driven by the LVDS output. Place the input termination resistor as close to the receiver input as possible. Termination resistors should match the differential impedance of the transmission line. Use 1% surface-mount resistors.

The MAX9176/MAX9177 feature an integrated differential output resistor. This resistor reduces jitter by damping reflections produced by any mismatch between the transmission line and termination resistor at the far end of the interconnect.

Board Layout

Separate the differential and single-ended signals to reduce crosstalk. A four-layer printed circuit board with separate layers for power, ground, differential signals,

and single-ended logic signals is recommended. Separate the differential signals from the logic signals with power and ground planes for best results.

IEC 61000-4-2 Level 4 ESD Protection

The IEC 61000-4-2 standard (Figure 10) specifies ESD tolerance for electronic systems. The IEC61000-4-2 model specifies a 150pF capacitor that is discharged into the device through a 330Ω resistor. The MAX9176/MAX9177 differential inputs and outputs are rated for IEC61000-4-2 level 4 ($\pm 8\text{kV}$ Contact Discharge and $\pm 15\text{kV}$ Air-Gap Discharge). The Human Body Model (HBM, Figure 9) specifies a 100pF capacitor that is discharged into the device through a $1.5\text{k}\Omega$ resistor.

IEC 61000-4-2 level 4 discharges higher peak current and more energy than the HBM due to the lower series resistance and larger capacitor.
