SY54023R

Low Voltage 1.2V/1.8V CML 2x2 Crosspoint Switch with Fail-Safe Inputs, 3.2Gbps, 2.5GHz

General Description

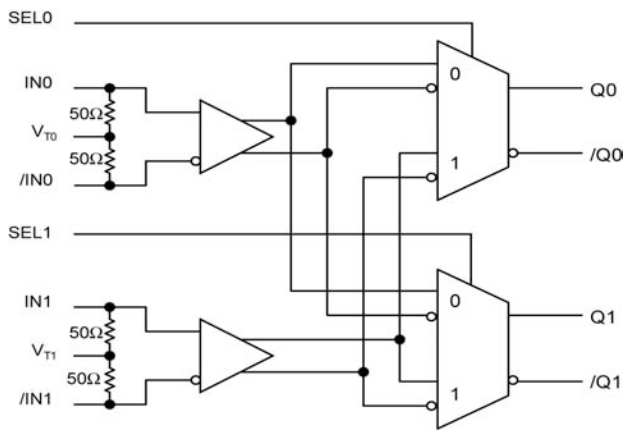
The SY54023R is a fully differential, low voltage 1.2V/1.8V CML 2x2 Crosspoint Switch with Fail Safe Inputs. The SY54023R can process clock signals as fast as 2.5GHz or data patterns up to 3.2Gbps.

The differential input includes Micrel's unique, 3-pin input termination architecture that interfaces to LVPECL, LVDS or CML differential signals, (AC- or DC-coupled from a 2.5V driver) as small as 100mV (200mV$_{PP}$) without any level-shifting or termination resistor networks in the signal path. For AC-coupled input interface applications, an internal voltage reference is provided to bias the V_T pin. The outputs are CML, with extremely fast rise/fall times guaranteed to be less than 95ps.

The SY54023R operates from a 2.5V ±5% core supply and a 1.8V or 1.2V ±5% output supply and is guaranteed over the full industrial temperature range (–40°C to +85°C). The SY54023R is part of Micrel's high-speed, Precision Edge® product line.

Datasheets and support documentation can be found on Micrel's web site at: www.micrel.com.

Functional Block Diagram



Precision Edge®

Features

- 1.2V/1.8V CML 2x2 Crosspoint Switch with Fail Safe Inputs
- Guaranteed AC performance over temperature and voltage:
  - DC-to- > 3.2Gbps throughput
  - <400ps propagation delay (IN-to-Q)
  - <15ps Output Skew
  - <95ps rise/fall times
- Ultra-low jitter design
  - <1ps$_{RMS}$ cycle-to-cycle jitter
  - <10ps$_{PP}$ total jitter
  - <1ps$_{RMS}$ random jitter
  - <10ps$_{PP}$ deterministic jitter
- High-speed CML outputs
- 2.5V ±5% , 1.8/1.2V ±5% power supply operation
- Industrial temperature range: –40°C to +85°C
- Available in 16-pin (3mm x 3mm) MLF® package

Applications

- Data Distribution: OC-48, OC-48+FEC
- SONET clock and data distribution
- Fibre Channel clock and data distribution
- Gigabit Ethernet clock and data distribution

Markets

- Storage
- ATE
- Test and measurement
- Enterprise networking equipment
- High-end servers
- Access
- Metro area network equipment

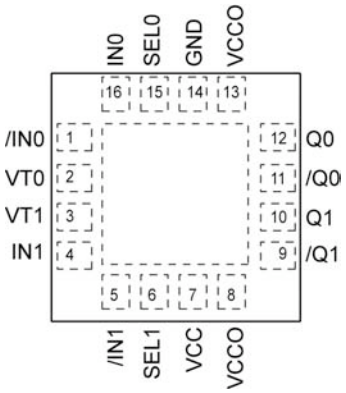
Ordering Information[1]

Part Number	Package Type	Operating Range	Package Marking	Lead Finish
SY54023RMG	MLF-16	Industrial	023R with Pb-Free bar-line indicator	NiPdAu Pb-Free
SY54023RMGTR[2]	MLF-16	Industrial	023R with Pb-Free bar-line indicator	NiPdAu Pb-Free

Notes:

1. Contact factory for die availability. Dice are guaranteed at T_A = 25°C, DC Electricals only.
2. Tape and Reel.

Pin Configuration



16-Pin MLF® (MLF-16)

Pin Description

Pin Number	Pin Name	Pin Function
16,1 4,5	IN0, /IN0 IN1,/IN1	Differential Inputs: These input pairs are the differential signal inputs to the device. They accept differential signals as small as 100mV (200mV$_{PP}$). Each input pin internally terminates with 50Ω to the VT pin. If the input swing falls below a certain threshold (typical 30mV), the Fail-Safe Input (FSI) feature will guarantee a stable output by latching the output to its last valid state.
2 3	VT0 VT1	Input Termination Center-Tap: Each side of the differential input pair terminates to VT pin. This pin provides a center-tap to a termination network for maximum interface flexibility. An internal high impedance resistor divider biases VT to allow input AC-coupling. For AC-coupling, bypass VT with a 0.1µF low ESR capacitor to VCC. See "Interface Applications" subsection and Figure 2a.
15 6	SEL0 SEL1	These single-ended TTL/CMOS-compatible inputs select the inputs of the crosspoint switch. Note that these inputs are internally connected to a 25kΩ pull-up resistor and will default to a logic HIGH state if left open.
7	VCC	Positive Power Supply: Bypass with 0.1µF//0.01µF low ESR capacitors as close to the V_{CC} pin as possible. Supplies input and core circuitry.
8,13	VCCO	Output Supply: Bypass with 0.1µF//0.01µF low ESR capacitors as close to the V_{CCO} pins as possible. Supplies the output buffers.
14	GND, Exposed pad	Ground: Exposed pad must be connected to a ground plane that is the same potential as the ground pin.
12,11 10,9	Q0, /Q0 Q1, /Q1	CML Differential Output Pairs: Differential buffered copies of the input signal. The output swing is typically 390mV. See "Interface Applications" subsection for termination information.

Absolute Maximum Ratings[1]

Supply Voltage (V_{CC}) ..... –0.5V to +3.0V
Supply Voltage (V_{CCO}) ..... –0.5V to +2.7V
V_{CC} - V_{CCO} ..... <1.8V
V_{CCO} - V_{CC} ..... <0.5V
Input Voltage (V_{IN}) ..... –0.5V to V_{CC}
CML Output Voltage (V_{OUT}).....0.6V to V_{CCO}+0.5V
Current (V_T)
Source or sink current on VT pin ..... ±100mA
Input Current
Source or sink current on (IN, /IN) ..... ±50mA
Maximum operating Junction Temperature.....125°C
Lead Temperature (soldering, 20sec.) .....260°C
Storage Temperature (T_s) .....–65°C to +150°C

Operating Ratings[2]

Supply Voltage (V_{CC}) ..... 2.375V to 2.625V
(V_{CCO})……..….1.14V to 1.9V
Ambient Temperature (T_A) .....–40°C to +85°C
Package Thermal Resistance[3]
MLF®
Still-air (θ_{JA}) ..... 75°C/W
Junction-to-board (ψ_{JB}) ..... 33°C/W

DC Electrical Characteristics[4]

T_A = –40°C to +85°C, unless otherwise stated.

Symbol	Parameter	Condition	Min	Typ	Max	Units
V_{CC}	Power Supply Voltage Range	V_{CC} V_{CCO} V_{CCO}	2.375 1.14 1.7	2.5 1.2 1.8	2.625 1.26 1.9	V V V
I_{CC}	Power Supply Current	Max. V_{CC}		42	55	mA
I_{CCO}	Power Supply Current	No Load. Max V_{CCO}		32	42	mA
R_{IN}	Input Resistance (IN-to-V_T, /IN-to-V_T)		45	50	55	Ω

V_{IH}	Input HIGH Voltage (IN, /IN)	IN, /IN	1.2		V_{CC}	V
V_{IL}	Input LOW Voltage (IN, /IN)	V_{IL} with V_{IH} = 1.2V	0.2		V_{IH}–0.1	V
V_{IH}	Input HIGH Voltage (IN, /IN)	IN, /IN	1.14		V_{CC}	V
V_{IL}	Input LOW Voltage (IN, /IN)	V_{IL} with V_{IH} = 1.14V, (1.2V-5%)	0.66		V_{IH}–0.1	V
V_{IN}	Input Voltage Swing (IN, /IN)	see Figure 3a	0.1		1.0	V
V_{DIFF_IN}	Differential Input Voltage Swing (|IN - /IN|)	see Figure 3b	0.2		2.0	V
V_{IN_FSI}	Input Voltage Threshold that Triggers FSI			30	100	mV
V_{T_IN}	Voltage from Input to V_T				1.28	V

Notes:

1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB. ψ_{JB} and θ_{JA} values are determined for a 4-layer board in still-air number, unless otherwise stated.
4. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.

	Duty Cycle	Differential I/O	47		53	%

Notes:

6. Input-to-Input skew is the difference in time between both inputs, measured at the same output, for the same temperature, voltage and transition.
7. Output-to-Output skew is the difference in time between both outputs, receiving data from the same input, for the same temperature, voltage and transition.
8. Part-to-part skew is defined for two parts with identical power supply voltages at the same temperature and no skew at the edges at the respective inputs. V_{IN} >200mV with input t_r/t_f ≤300ps (20% to 80%).
9. Random jitter is measured with a K28.7 pattern, measured at ≤ f_{MAX}.
10. Deterministic jitter is measured at 2.5Gbps with both K28.5 and 2^{23}–1 PRBS pattern.
11. Cycle-to-cycle jitter definition: the variation period between adjacent cycles over a random sample of adjacent cycle pairs. $t_{JITTER\_CC} = T_n - T_{n+1}$, where T is the time between rising edges of the output signal.
12. Total jitter definition: with an ideal clock input frequency of ≤ f_{MAX} (device), no more than one output edge in 10^{12} output edges will deviate by more than the specified peak-to-peak jitter value.
13. Crosstalk induced jitter is defined as the added jitter that results from signals applied to the adjacent channel. It is measured at the output while applying a similar, differential clock frequency to both inputs that is asynchronous with respect to each other.

Functional Description

Fail-Safe Input (FSI)

The input includes a special failsafe circuit to sense the amplitude of the input signal and to latch the output when there is no input signal present, or when the amplitude of the input signal drops sufficiently below $100mV_{PK}$ ($200mV_{PP}$), typically $30mV_{PK}$. Maximum frequency of the SY54023R is limited by the FSI function.

Input Clock Failure Case

If the input clock fails to a floating, static, or extremely low signal swing, the FSI function will eliminate a metastable condition and guarantee a stable output. No ringing and no undetermined state will occur at the output under these conditions.

Note that the FSI function will not prevent duty cycle distortion in case of a slowly deteriorating (but still toggling) input signal close to the FSI threshold. Due to the FSI function, the propagation delay will depend on rise and fall time of the input signal and on its amplitude. Refer to “Typical Characteristics” for detailed information

Interface Applications

For Input Interface Applications, see Figures 4a through 4f and for CML Output Termination, see Figures 5a through 5d.

CML Output Termination with VCCO 1.2V

For VCCO of 1.2V, Figure 5a, terminate the output with 50Ω-to-1.2V, DC-coupled, not 100Ω differentially across the outputs.

If AC-coupling is used, Figure 5d, terminate into 50Ω-to-1.2V before the coupling capacitor and then connect to a high value resistor to a reference voltage.

Do not AC couple with internally terminated receiver. For example, 50Ω ANY-IN input. AC-coupling will offset the output voltage by 200mV and this offset voltage will be too low for proper driver operation.

Any unused output pair needs to be terminated when VCCO is 1.2V, do not leave floating.

CML Output Termination with VCCO 1.8V

For VCCO of 1.8V, Figure 5a and Figure b, terminate with either 50Ω-to-1.8V or 100Ω differentially across the outputs. AC- or DC-coupling is fine.

Input AC Coupling

The SY54023R input can accept AC-coupling from any driver. Bypass VT with a 0.1µF low ESR capacitor to VCC as shown in Figures 4c and 4d. VT has an internal high impedance resistor divider as shown in Figure 2a, to provide a bias voltage for AC-coupling.
