

# Linear Single Cell Li-Ion Battery Charger with Auto Power Path

## General Description

The RT9525 is an integrated single cell Li-ion battery charger with Auto Power Path Management (APPM). No external MOSFETs are required. The RT9525 enters sleep mode when power is removed. Charging tasks are optimized by using a control algorithm to vary the charge rate including pre-charge mode, fast charge mode and constant voltage mode. For the RT9525, the charge current can also be programmed with an external resistor. Additionally, the internal thermal feedback circuitry regulates the die temperature to optimize the charge rate for all ambient temperatures. The charging task will always be terminated in constant voltage mode when the charging current reduces to the termination current of 20%  $I_{CHG\_FAST}$ . Other features include under voltage protection and over voltage protection for the VIN supply.

## Ordering Information

RT9525□□

Package Type  
QW : WQFN-16L 3x3 (W-Type)  
Lead Plating System  
G : Green (Halogen Free and Pb Free)

Note :

Richtek products are :

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes.

## Marking Information

JG = : Product Code  
YMDNN : Date Code

## Features

- 28V Maximum Rating for VIN Power
- Selectable Power Current Limit (0.1A / 0.5A / 1.5A)
- Integrated Power MOSFETs
- Auto Power Path Management (APPM)
- Programmable Charging Current Timer and Safe Charge Timer
- Under Voltage Protection
- Over Voltage Protection
- Power Good and Charger Status Indicator
- Optimized Charge Rate via Thermal Feedback
- 16-Lead WQFN Package
- RoHS Compliant and Halogen Free

## Applications

- Digital Cameras
- PDAs and Smart Phones
- Portable Instruments

## Typical Application Circuit

## Functional Pin Description

| Pin No.             | Pin Name                  | Pin Function                                                                                                                                                                                                                                                                                               |
|---------------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1                   | TS                        | Thermistor Monitor Input. The TS pin connects to a battery's thermistor to determine if the battery is too hot or too cold to charge. If the battery's temperature is out of range, charging is paused until it re-enters the valid range. TS also detect whether the battery (with NTC) is present or not |
| 2, 3                | BAT                       | Battery Connect Pin.                                                                                                                                                                                                                                                                                       |
| 4                   | $\overline{\text{EN}}$    | Charge Enable, Active-low input. 200k $\Omega$ pull low.                                                                                                                                                                                                                                                   |
| 5                   | EN2                       | Input Current Limit Configuration Setting.                                                                                                                                                                                                                                                                 |
| 6                   | EN1                       |                                                                                                                                                                                                                                                                                                            |
| 7                   | $\overline{\text{PGOOD}}$ | Power Good Status Output. Active-low, open-drain output.                                                                                                                                                                                                                                                   |
| 8, 17 (Exposed Pad) | GND                       | Ground. The exposed pad must be soldered to a large PCB and connected to GND for maximum power dissipation.                                                                                                                                                                                                |
| 9                   | $\overline{\text{CHG}}$   | Charger Status Output. Active-low, open-drain output.                                                                                                                                                                                                                                                      |
| 10, 11              | SYS                       | System Connect Pin. Connect this pin to system load with a minimum 10uF MLCC to GND.                                                                                                                                                                                                                       |
| 12                  | NC                        | No Internal Connection.                                                                                                                                                                                                                                                                                    |
| 13                  | VIN                       | Supply Voltage Input.                                                                                                                                                                                                                                                                                      |
| 14                  | TIMER                     | Safe Charge Timer Setting.                                                                                                                                                                                                                                                                                 |
| 15                  | SYSOFF                    | System Disconnect Pin. Pull SYSOFF high to disconnect SYS from battery, connect to GND for normal operation. Internally pulled up by 1 $\mu$ A current source to BAT.                                                                                                                                      |
| 16                  | ISETA                     | Charge Current Set Input. Connect a resistor (R <sub>ISETA</sub> ) between ISET and GND.                                                                                                                                                                                                                   |

## Function Block Diagram

**Absolute Maximum Ratings** (Note 1)

|                                                                  |                |
|------------------------------------------------------------------|----------------|
| • Supply Input Voltage, $V_{IN}$ -----                           | -0.3V to 28V   |
| • $\overline{CHG}$ , $\overline{PGOOD}$ -----                    | -0.3V to 28V   |
| • Other Pins -----                                               | -0.3V to 6V    |
| • $\overline{CHG}$ , $\overline{PGOOD}$ Continuous Current ----- | 20mA           |
| • BAT Continuous Current (total in two pins) (Note 2) -----      | 2.5A           |
| • Power Dissipation, $P_D$ @ $T_A = 25^\circ\text{C}$            |                |
| WQFN-16L 3x3 -----                                               | 1.471W         |
| • Package Thermal Resistance (Note 3)                            |                |
| WQFN-16L 3x3, $\theta_{JA}$ -----                                | 68°C/W         |
| WQFN-16L 3x3, $\theta_{JC}$ -----                                | 7.5°C/W        |
| • Lead Temperature (Soldering, 10 sec.) -----                    | 260°C          |
| • Junction Temperature -----                                     | 150°C          |
| • Storage Temperature Range -----                                | -65°C to 150°C |
| • ESD Susceptibility (Note 4)                                    |                |
| HBM (Human Body Mode) -----                                      | 2kV            |
| MM (Machine Mode) -----                                          | 200V           |

**Recommended Operating Conditions** (Note 5)

|                                                           |                |
|-----------------------------------------------------------|----------------|
| • Supply Input Voltage, $V_{IN}$ (EN2 = H, EN1 = L) ----- | 4.45V to 6V    |
| • Supply Input Voltage, $V_{IN}$ (EN2 = L, EN1 = X) ----- | 4.65V to 6V    |
| • Junction Temperature Range -----                        | -40°C to 125°C |
| • Ambient Temperature Range -----                         | -40°C to 85°C  |

**Electrical Characteristics**

(VIN = 5V, VBAT = 4V, TA = 25°C, unless otherwise specification)

**Note 1.** Stresses listed as the above “Absolute Maximum Ratings” may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

**Note 2.** Guaranteed by design.

**Note 3.**  $\theta_{JA}$  is measured in natural convection at  $T_A = 25^\circ C$  on a high-effective thermal conductivity four-layer test board of JEDEC 51-7 thermal measurement standard. The measurement case position of  $\theta_{JC}$  is on the exposed pad of the package.

**Note 4.** Devices are ESD sensitive. Handling precaution is recommended.

**Note 5.** The device is not guaranteed to function outside its operating conditions.

## Application Information

The RT9525 is a fully integrated single cell Li-ion battery charger ideal for portable applications. The internal thermal feedback circuitry regulates the die temperature to optimize the charge rate for all ambient temperatures. Other features include under voltage protection and over voltage protection.

### Pre-Charge Mode

When the output voltage is lower than 2.8V, the charging current will be reduced to a fast charge current ratio set by  $R_{ISETA}$  to protect the battery life time.

### Fast Charge Mode

When the output voltage is higher than 3V, the charging current will be equal to the fast charge current set by  $R_{ISETA}$ .

### Constant Voltage Mode

When the output voltage is near 4.2V and the charging current falls below the termination current, after a deglitch time check of 25ms, the charger will become disabled and  $\overline{CHG}$  will go from L to H.

### Re-Charge Mode

When the chip is in charge termination mode, the charging current will gradually go down to zero. However, once the voltage of the battery drops to below 4V, there will be a deglitch time of 100ms, and then the charging current will resume again.

### Charging Current Decision

The charge current can be set according to the following equations :

$$I_{CHG\_FAST} = V_{ISETA} / R_{ISETA} \times 300 \quad (A)$$

$$I_{CHG\_PRE} = 10\% \times I_{CHG\_FAST} \quad (A)$$

where  $V_{ISETA}$  unit = V;  $R_{ISETA}$  unit =  $\Omega$

### Time Fault

The Fast Charge Fault Time can be set according to the following equations :

$$\text{Fast Charge Fault Time : } t_{FCHG} = 14400 \times C_{TIMER} \quad (s)$$

$$\text{Pre-Charge Fault Time : } t_{PCHG} = 1/8 \times t_{FCHG} \quad (s)$$

where  $C_{TIMER}$  unit is  $\mu F$ .

During the fast charge phase, several events may increase the timer duration.

For example, the system load current may have activated the APPM loop which reduces the available charging current, the device has entered thermal regulation because the IC junction temperature has exceeded  $T_{REG}$ .

During each of these events, if  $3V < V_{BAT} < 4V$ , the internal timers are slowed down proportionately to the reduction in charging current. However, once the duration exceeds the fault time, the  $\overline{CHG}$  output will flash at approximately 2Hz to indicate a fault condition and a charger current  $\sim 1mA$ .

$$t_{FCHG\_true} = t_{FCHG} \times \frac{2}{V_{ISETA}}$$

$t_{FCHG\_true}$  : modified timer in fast charge

$t_{FCHG}$  : original timer in fast charge

$$t_{FCHG} = 14400 \text{ sec} \times \left( \frac{C_{TIMER}}{1\mu F} \right)$$

$$t_{PCHG} = \frac{t_{FCHG}}{8}$$

$t_{PCHG}$  : timer in pre-charge

Time fault release :

- (1) Re-plug power
- (2) Toggle /EN
- (3) Enter/Exit USB suspend mode
- (4) Removes Battery
- (5) OVP

Note that the fast charge fault time is independent of the charge current.

### Power Good

VIN Power Good ( $\overline{PGOOD} = L$ )

| Input State                               | $\overline{PGOOD}$ Output |
|-------------------------------------------|---------------------------|
| $V_{IN} < V_{UVLO}$                       | High impedance            |
| $V_{UVLO} < V_{IN} < V_{BAT} + V_{OS\_H}$ | High impedance            |
| $V_{BAT} + V_{OS\_H} < V_{IN} < V_{OVP}$  | Low impedance             |
| $V_{IN} > V_{OVP}$                        | High impedance            |

### Charge State Indicator

| Charge State                        | CHG Output                   |
|-------------------------------------|------------------------------|
| Charging                            | Low (for first charge cycle) |
| Charging suspended by thermal loop  |                              |
| Safety timers expired               | 2Hz flash                    |
| Charging done                       | High impedance               |
| Recharging after termination        |                              |
| IC disabled or no valid input power |                              |

### Battery Pack Temperature Monitoring

The RT9525 features an external battery pack temperature monitoring input. The TS input connects to the NTC thermistor in the battery pack to monitor battery temperature and prevent dangerous over temperature conditions. If at any time the voltage at TS falls outside of the operating range, charging will be suspended. The timers maintain their values but suspend counting. When charging is suspended due to a battery pack temperature fault, the CHG pin remains low and continues to indicate charging.

Figure 1

When temperature reaches at “Too Cold” state,

$$R_{NTC} = R_{COLD}$$

$$\frac{(R_{T1} + R_{COLD}) \times R_{T2}}{(R_{T1} + R_{COLD}) + R_{T2}} \times I_{NTC} = 2.1V \quad (V) \quad (1)$$

where  $I_{NTC} = 75\mu A$  (typ.)

When temperature reaches at “Too Hot” state,

$$R_{NTC} = R_{HOT}$$

$$\frac{(R_{T1} + R_{HOT}) \times R_{T2}}{(R_{T1} + R_{HOT}) + R_{T2}} \times I_{NTC} = 0.3V \quad (V) \quad (2)$$

From (1), (2), the  $R_{T1}$  and  $R_{T2}$  can be calculated by the following equations :

$$R_{T1} = \frac{-1500\mu \times (R_{HOT} + R_{COLD})}{3000\mu} + \frac{20\sqrt{5625\mu^2 \times (R_{COLD} - R_{HOT})^2 + 105\mu \times (R_{COLD} - R_{HOT})}}{3000\mu}$$

$$R_{T2} = \frac{(R_{T1} + R_{HOT})}{250\mu \times R_{T1} + 250\mu \times R_{HOT} - 1}$$

### Charge Enable

When  $\overline{EN}$  is low, the charger turns on. When  $\overline{EN}$  is high, the charger turn off.  $\overline{EN}$  is pulled low for initial condition.

### VIN Input Current Limit

| EN2 | EN1 | VIN Input Current Limit |
|-----|-----|-------------------------|
| L   | L   | 90mA                    |
| L   | H   | 475mA                   |
| H   | L   | 1.5A                    |
| H   | H   | Suspend Mode            |

### Suspend Mode

Set  $EN1 = EN2 = H$ , and the charger will enter Suspend Mode. In Suspend Mode,  $\overline{CHG}$  is in high impedance and  $I_{SUS(MAX)} < 330\mu A$ .

### Power Switch

For the RT9525, there are three power scenarios :

- (1) When a battery and an external power supply (USB or adapter) are connected simultaneously :  
If the system load requirements exceed that of the input current limit, the battery will be used to supplement the current to the load. However, if the system load requirements are less than that of the input current limit, the excess power from the external power supply will be used to charge the battery.
- (2) When only the battery is connected to the system :  
The battery provides the power to the system.
- (3) When only an external power supply is connected to the system :  
The external power supply provides the power to the system.

## Input DPM Mode

For the RT9525, the input voltage is monitored when the USB100 or USB500 is selected. If the input voltage is lower than  $V_{DPM}$ , the input current limit will be reduced to stop the input voltage from dropping any further. This can prevent the IC from damaging improperly configured or inadequately designed USB sources.

## APPM Mode

Once the sum of the charging and system load currents becomes higher than the maximum input current limit, the SYS pin voltage will be reduced. When the SYS pin voltage is reduced to  $V_{APPM}$ , the RT9525 will automatically operate in APPM mode. In this mode, the charging current is reduced while the SYS current is increased to maintain system output. In APPM mode, the battery termination function is disabled.

## Battery Supplement Mode Short Circuit Protect

In APPM mode, the SYS voltage will continue to drop if the charge current is zero and the system load increases beyond the input current limit. When the SYS voltage decreases below the battery voltage, the battery will kick in to supplement the system load until the SYS voltage rises above the battery voltage.

While in supplement mode, there is no battery supplement current regulation. However, a built in short circuit protection feature is available to prevent any abnormal current situations. While the battery is supplementing the load, if the difference between the battery and SYS voltage becomes more than the short circuit threshold voltage, SYS will be disabled. After a short circuit recovery time,  $t_{SHORT\_R}$ , the counter will be restarted. In supplement mode, the battery termination function is disabled. Note that for the battery supply mode exit condition,  $V_{BAT} - V_{SYS} < 0V$ .

## Battery Disconnect (SYSOFF input)

The RT9525 features a SYSOFF input that allows the user to turn off the switch to disconnect the battery from the SYS pin.

## Thermal Regulation and Thermal Shutdown

The RT9525 provides a thermal regulation loop function to monitor the device temperature. If the die temperature rises above the regulation temperature,  $T_{REG}$ , the charge current will automatically be reduced to lower the die temperature. However, in certain circumstances (such as high  $V_{IN}$ , heavy system load, etc.) even with the thermal loop in place, the die temperature may still continue to increase. In this case, if the temperature rises above the thermal shutdown threshold,  $T_{SD}$ , the internal switch between  $V_{IN}$  and SYS will be turned off. The switch between the battery and SYS will remain on, however, to allow continuous battery power to the load. Once the die temperature decreases by  $\Delta T_{SD}$ , the internal switch between  $V_{IN}$  and SYS will be turned on again and the device returns to normal thermal regulation.

#### Thermal Considerations

For continuous operation, do not exceed absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated by the following formula :

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where  $T_{J(MAX)}$  is the maximum junction temperature,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction to ambient thermal resistance.

For recommended operating condition specifications of the RT9525, the maximum junction temperature is 125°C and  $T_A$  is the ambient temperature. The junction to ambient thermal resistance,  $\theta_{JA}$ , is layout dependent. For WQFN-16L 3x3 packages, the thermal resistance,  $\theta_{JA}$ , is 68°C/W on a standard JEDEC 51-7 four-layer thermal test board. The maximum power dissipation at  $T_A = 25^\circ\text{C}$  can be calculated by the following formula :

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (68^\circ\text{C/W}) = 1.471\text{W for WQFN-16L 3x3 package}$$

The maximum power dissipation depends on the operating ambient temperature for fixed  $T_{J(MAX)}$  and thermal resistance,  $\theta_{JA}$ . For the RT9525 package, the derating curve in Figure 2 allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

Figure 2. Derating Curve for the RT9525 Package

## Layout Considerations

The RT9525 is a fully integrated low cost single cell Li-Ion battery charger ideal for portable applications. Careful PCB layout is necessary. For best performance, place all peripheral components as close to the IC as possible. A short connection is highly recommended. The following guidelines should be strictly followed when designing a PCB layout for the RT9525.

- ▶ Input and output capacitor should be placed close to IC and connected to ground plane. The trace of input in the PCB should be placed far away from the sensitive devices AND shielded by the ground.
- ▶ The GND and exposed pad should be connected to a strong ground plane for heat sinking and noise protection.
- ▶ The connection of  $R_{ISETA}$  should be isolated from other noisy traces. A short wire is recommended to prevent EMI and noise coupling.
