

## Evaluation Board for CS4334/8/9 Family of Products

#### **Features**

- Demonstrates recommended layout and grounding arrangements
- CS8414 Receives AES/EBU, S/PDIF, & EIAJ-340 Compatible Digital Audio
- Digital and Analog Patch Areas
- Requires only a digital signal source and power supplies for a complete Digital-to-Analog-Converter system

## **Description**

The CDB4334/8/9 evaluation board is an excellent means for quickly evaluating the CS4334/8/9 family of 24-bit, stereo D/A converters. Evaluation requires an analog signal analyzer, a digital signal source and a power supply. Analog outputs are provided via RCA connectors for both channels.

The CS8414 digital audio receiver I.C. provides the system timing necessary to operate the Digital-to-Analog converters and will accept AES/EBU, S/PDIF, and EIAJ-340 compatible audio data. The evaluation board may also be configured to accept external timing signals for operation in a user application during system development.

#### **ORDERING INFORMATION**

CDB4334, CDB4338, CDB4339

Preliminary Product Information

This document contains information for a new product.
Cirrus Logic reserves the right to modify this product without notice.

### CDB4334/8/9 SYSTEM OVERVIEW

The CDB4334/8/9 evaluation board is an excellent means of quickly evaluating the CS4334/8/9. The CS8414 digital audio interface receiver provides an easy interface to digital audio signal sources including the majority of digital audio test equipment. The evaluation board also allows the user to supply clocks and data through a 10-pin header for system development.

The CDB4334/8/9 schematic has been partitioned into 7 schematics shown in Figures 2 through 8. Each partitioned schematic is represented in the system diagram shown in Figure 1. Notice that the the system diagram also includes the interconnections between the partitioned schematics.

The CS8414 does not support a compatible data format for the CS4335, CS4336 or CS4337. As a result, an evaluation board is not available for these devices. However, the evaluation board does allow external generation of clocks and data, bypassing the CS8414, and will support the CS4335/36/37 in this configuration.

# CS4334/8/9 DIGITAL TO ANALOG CONVERTER

A description of the CS4334/5/6/7/8/9 is included in the CS4334/5/6/7/8/9 data sheet.

## **CS8414 DIGITAL AUDIO RECEIVER**

The system receives and decodes the standard S/PDIF data format using a CS8414 Digital Audio Receiver, Figure 5. The outputs of the CS8414 include a serial bit clock, serial data, left-right clock (FSYNC), de-emphasis control and a 256 Fs master clock. The operation of the CS8414 and a discussion of the digital audio interface are included in the CS8414 Datasheet.

During normal operation, the CS8414 operates in the Channel Status mode where the LED's display channel status information for the channel selected by the CSLR/FCK jumper. This allows the CS8414 to decode the de-emphasis bit from the digital audio interface for control of the CS4334/8/9 de-emphasis filter.

When the Error Information Switch is activated, the CS8414 operates in the Error and Frequency information mode. The information displayed by the LED's can be decoded by consulting the CS8414 data sheet. It is likely that the de-emphasis control for the CS4334/8/9 will be erroneous and produce an incorrect audio output if the Error Information Switch is activated and the CS4334/8/9 is in the internal serial clock mode.

Encoded sample frequency information can be displayed provided a proper clock is being applied to the FCK pin of the CS8414. When an LED is lit, this indicates a "1" on the corresponding pin located on the CS8414. When an LED is off, this indicates a "0" on the corresponding pin. Neither the L or R option of CSLR/FCK should be selected if the FCK pin is being driven by a clock signal.

The evaluation board has been designed such that the input can be either optical or coax, Figure 6. However, both inputs can not be driven simultaneously.

### **CS8414 DATA FORMAT**

The CS8414 data format can be set with jumpers M0, M1, M2, and M3, as described the CS8414 datasheet. The format selected must be compatible with the data format of the CS4334/8/9, shown in Figures 4-7 of the CS4334/8/9 datasheet. The default settings for M0-M3 on the evaluation board are given in Tables 2-4. The compatible data formats we have chosen for the CS8414 and CS4334/8/9 are:

CS8414 format 2; CS4334

CS8414 format 5 ; CS4338

CS8414 format 6; CS4339

### ANALOG OUTPUT FILTER

The evaluation board includes a pair of single pole passive filters and a pair of 3-pole active filters. The passive filters are provided as an example for cost-sensitive desigins. The active filters demonstrate a higher performance alternative with better out-of-band noise rejection. The passive filters, Fig. 4, have a corner frequency of approximately 95 kHz with JP3 and JP6 installed and 190 kHz without JP3 and JP6. The 3-pole active filters are shown in Fig. 3. The output filter options are selected via the Left and Right Channel filter jumpers, Fig. 2.

## INPUT/OUTPUT FOR CLOCKS AND DATA

The evaluation board has been designed to allow the interface to external systems via the 10-pin header, J9. This header allows the evaluation board to accept externally generated clocks and data. The schematic for the clock/data I/O is shown in Figure 10. The 74HC243 transceiver functions as an I/O buffer where jumpers HDR1-HDR6 determine if the transceiver operates as a transmitter or receiver. A transmit function is implemented with the HDR1-HDR6 jumpers in the 8414 position. LRCK, SDATA, and SCLK from the CS8414 will be outputs on J9. The transceiver operates as a receiver with jumpers HDR1-HDR6 in the EXTERNAL position. MCLK, LRCK, SDATA and SCLK on J9 become inputs.

# GROUNDING AND POWER SUPPLY DECOUPLING

The CS4334/8/9 requires careful attention to power supply and grounding arrangements to optimize performance. Figure 9 shows CDB power arrangements. The CDB4334/8/9 ground plane is divided in a manner to control to digital return currents in order to minimize noise. The decoupling capacitors are located as close to the CS4334/8/9 as possible. Extensive use of ground plane fill on both the analog and digital sections of the evaluation board yield large reductions in radiated noise effects.

| CONNECTOR     | INPUT/OUTPUT | SIGNAL PRESENT  |  |
|---------------|--------------|---|--|
| +5 V          | input        | + 5 Volt power  |  |
|               |              |   |  |
| GND           | input        | ground connection from power supply                         |  |
| Digital input | input        | digital audio interface input via coax                      |  |
| Optical input | input        | digital audio interface input via optical                   |  |
| Digital I/O   | input/output | I/O for master, serial, left/right clocks and serial data   |  |
| AOUTLA        | output       | left channel analog output with 3-pole active filter        |  |
| AOUTRA        | output       | right channel analog output with 3-pole active filter       |  |
| AOUTLP        | output       | left channel analog output with single-pole passive filter  |  |
| AOUTRP        | output       | right channel analog output with single-pole passive filter |  |
