

# IS31LT3360 3CH DEMO Board Guide

## Description

The IS31LT3360 is a continuous mode inductive step-down converter, designed for driving a single LED or multiple series connected LEDs efficiently from a voltage source higher than the LED voltage. The chip operates from an input supply between 6V and 40V and provides an externally adjustable output current of up to 1.2A.

The IS31LT3360 includes an integrated output switch and a high-side output current sensing circuit, which uses an external resistor to set the nominal average output current.

Output current can be adjusted linearly by applying an external control signal to the ADJ pin. The ADJ pin will accept either a DC voltage or a PWM waveform. This will provide either a continuous or a gated output current.

Applying a voltage of 0.2V or lower to the ADJ pin turns the output off and switches the chip into a low current standby state.

The chip is assembled in SOT89-5 package. IS31LT3360 3CH DEMO board is used in RGB lamp or general LED lamp applications.

## Features

- ✓ Simple low parts count
- ✓ Internal 40V power switch
- ✓ Wide input voltage range: 6V to 40V
- ✓ Up to 1.2A output current
- ✓ High efficiency (up to 98% )
- ✓ Typical 1200:1 dimming rate
- ✓ Typical 3% output current accuracy
- ✓ Single pin on/off and brightness control using DC voltage or PWM
- ✓ Up to 1MHz switching frequency
- ✓ Inherent open-circuit LED protection
- ✓ Thermal shutdown protection circuitry

## Quick Start

Figure 1: Photo of IS31LT3360-SDL3-EB3CH

## Recommended Equipment

- ✓ 40VDC Power supply
- ✓ 3 pcs of LED panel (3W LED, 10 LEDs in series on each panel)
- ✓ Multi-meter

## Recommended Input and Output Ratings

- ✓ Input: 6-40VDC
  - ✓ Output: 1-10 LEDs in series/667mA
- Note: The input voltage must be 2V higher than the output voltage(total Vf).

## Absolute Maximum Ratings

- ✓ Input voltage  $\leq$  40VDC
- Caution: Do not exceed the conditions listed above, otherwise the board will be damaged.

## Procedure

The IS31LT3360 DEMO Board is fully assembled and tested. Follow the steps listed below to verify board operation.

Caution: Do not turn on the power supply until all connections are completed.

- 1) Connect the terminals of the power supply to the AC1 and AC2 pin(If the board don't have the rectifier(D1-D4), Connect the positive terminal of the power supply to the DC+ of the board and the negative terminal of power supply to the DC- of the board) .
- 2) Connect the negative of the one of LED panel (LED arrays) to the LED1- terminal. And connect the positive of the same LED panel (LED arrays) to the LED1+ terminal.
- 3) Connect the other two LED panels to LED2 and LED3 as above.
- 4) Turn on the power supply and the LED panels (LED arrays) will be light.

## Ordering Information

Part No.	Temperature Range	Package
IS31LT3360-SDL3-EB3H	-40°C ~ +85°C (Industrial)	SOT 89-5 (3mmx3mm)

## Detailed Description

### LED Current Control

The nominal average output current in the LED(s) is determined by the value of the external current sense resistor ( $R_S$ ) connected between  $V_{IN}$  and  $I_{SENSE}$  and is given by:

$$I_{OUT\ nom} = 0.1/R_S \text{ [for } R_S > 0.082\Omega \text{]}$$

The table below gives values of nominal average output current for several preferred values of current setting resistor ( $R_S$ ) in the typical application circuit shown on page 1:

$R_S$ ( $\Omega$ )	Nominal average output current (mA)
0.082	1200
0.1	1000
0.15	667
0.3	333

$V_{sense}$  is divided into two range to improve current accuracy, please refer to bin information on page 3. The above values assume that the ADJ pin is floating and at a nominal voltage of  $V_{REF} = 1.2V$ . Note that  $R_S = 0.082\Omega$  is the minimum allowed value of sense resistor under these conditions to maintain switch current below the specified maximum value. It is possible to use different values of  $R_S$  if the ADJ pin is driven from an external voltage.

### Inductor selection

Recommended inductor values are  $47\mu H$  to  $220\mu H$ . Higher values of inductance are recommended at higher supply voltages and low output current in order to minimize errors due to switching delays, which result in increased ripple and lower efficiency. Higher values of inductance also result in a smaller change in output

current over the supply voltage range. The inductor should be mounted as close to LX pin as possible with low resistance connections to LX and  $V_{IN}$  pins.

### PCB layout consideration

#### Decoupling capacitors and coil

It is particularly important to mount the coil and the input decoupling capacitor close to the chip to minimize parasitic resistance and inductance, which will degrade efficiency. The input decoupling capacitor ( $0.1\mu F$  fixed) must be placed as close to the  $V_{in}$  and GND pins as possible. It is also important to take account of any trace resistance in series with current sense resistor  $R_S$ .

#### LX pin

The LX pin of the chip is a fast switching node, so PCB traces should be kept as short as possible. To minimize ground 'bounce', the ground pin of the chip should be soldered directly to the ground plane.

#### ADJ pin

The ADJ pin is a high impedance input, so when left floating, PCB traces to this pin should be as short as possible to reduce noise pickup. ADJ pin can also be connected to a voltage between  $1.2V \sim 5V$ . In this case, the internal circuit will clamp the output current at the value which is set by  $ADJ = 1.2V$ .

#### High voltage traces

Avoid running any high voltage traces close to the ADJ pin, to reduce the risk of leakage due to board contamination. Any such leakage may raise the ADJ pin voltage and cause excessive output current. A ground ring placed around the ADJ pin will minimize changes in output current under these conditions.

## PCB Layout

NOTE: Physical dimensions are (L x W x H): 58mm x 25mm x 22mm

## Revision History

Date	Revision	Changes
2012.03.06	R1.0	Initial release
2012.04.19	R1.1	1. Recommend equipment: 60V change to 40V. 2. BOM: Add Cap tolerance value. 3. BOM: C2,C3,C4 100uF change to 22uF. 4. BOM: C8,C9,C10 1nF change to 390pF. 5. BOM: Add R5, R7, R9 6. Add order information.
2013.05.15	R1.2	1. Revise the BOM of R1-R9. 2. Revise the schematic.
