

28 V, 56 mΩ, Load Switch with Programmable Current Limit and Slew Rate Control

OPERATION DESCRIPTION

SiP32419 and SiP32429 are load switches that integrate multiple control features that simplify the design and increase the reliability of the circuitry connected to the switch. Both devices are 56 mΩ switches designed to operate in the 6 V to 28 V range. An internally generated gate drive voltage ensures good R_{ON} linearity over the input voltage operating range.

The SiP32419 and SiP32429 have a slew rate control circuit that controls the switch turn-on time to the value set by an external capacitor.

After soft start, an over-current protection circuit (OCP) continuously monitors the current through the load switch, and controls the switch impedance to limit the current to the level programmed by an external resistor. If the over-current condition persists for more than 7 ms, the switch shuts off automatically. The SiP32419 and SiP32429 has an over temperature protection circuit (OTP) which will shut the switch off if the junction temperature exceeds about 135 °C. The OTP circuit will release the switch when the temperature has decreased by about 40 °C of hysteresis.

When an OCP or an OTP fault condition is detected the FLG pin is pulled low. For the SiP32429, the fault flag will release 150 ms after the fault condition is cleared, and the switch will automatically turn on at the programmed slew rate. For the SiP32419, the switch will remain off and the fault flag will remain on. The switch will be reset by toggling either control signal on EN pin or the input power if it is not under over temperature fault condition.

These devices feature a low voltage control logic interface which can be controlled without the need for level shifting. These devices also include a power good flag.

SiP32419 and SiP32429 are available in a space efficient DFN10 3 mm x 3 mm package.

FEATURES

- 6 V to 28 V operation
- Programmable soft start
- Programmable current limit
- Over temperature protection
- ON resistance 56 mΩ
- Power good, when V_{OUT} reaches 90 % of V_{IN}
- Fault flag
- Under voltage lockout: 4.8 V / 5.4 V (typ. / max.)
- Package: DFN10 3 mm x 3 mm
- SiP32429 will turn OFF the switch under fault conditions, and re-try to turn on through the full soft start procedure 150 ms after the switch is off if there is no OT fault.
- SiP32419 will turn OFF the switch under fault conditions and remain OFF. The switch can be reset by toggling either signal on EN pin or the input power if it is not under over temperature fault condition.
- Material categorization: for definitions of compliance please see www.vishay.com/doc?99912

APPLICATIONS

- Personal computers
- Lighting
- Flat panel displays
- Game consoles
- Industrial
- Network communication
- Data storage

**ORDERING INFORMATION**

| TEMPERATURE RANGE | PACKAGE | MARKING | PART NUMBER |
|-------------------|-------------------|---------|-------------------|
| -40 °C to +85 °C | DFN10 3 mm x 3 mm | 2429 | SiP32429DN-T1-GE4 |
| | | 2419 | SiP32419DN-T1-GE4 |

Note

- GE4 denotes halogen-free and RoHS-compliant

ABSOLUTE MAXIMUM RATINGS

| PARAMETER | LIMIT | UNIT |
|---|--------------------------|------|
| Input Voltage (V_{IN}) | -0.3 to 30 | V |
| Output Voltage (V_{OUT}) | -0.3 to $V_{IN} + 0.3$ V | |
| PG Voltage | -0.3 to 30 | |
| FLG Voltage | -0.3 to 30 | |
| EN Voltage | -0.3 to 6 | |
| Maximum Continuous Switch Current | 4.5 | A |
| ESD Rating (HBM) | 4000 | V |
| Maximum Junction Temperature | 150 | °C |
| Storage Temperature | -55 to +150 | |
| Thermal Resistance (θ_{JA}) ^a | 88 | °C/W |
| Power Dissipation (P_D) ^{a, b} | 1.42 | W |

Notes

- a. Device mounted with all lead and power pad soldered or welded to PCB.
b. Derate 11.4 mW/°C above $T_A = 25$ °C.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING RANGE

| PARAMETER | LIMIT | UNIT |
|------------------------------------|---------------|------|
| Input Voltage (V_{IN}) | 6 to 28 | V |
| V_{SS} | 0 to 6 | |
| V_{OUT} | 0 to 28 | |
| EN | 0 to 6 | |
| \overline{FLG} , \overline{PG} | 0 to V_{IN} | |
| I_{LIM} | 0 to 6 | |
| Current Limit | 0.75 to 3.5 | A |
| Operating Temperature Range | -40 to +85 | °C |

| SPECIFICATIONS | | | | | | | |
|---|----------------|--|---|------|----------------------|------|--------------------|

PIN CONFIGURATION

**Fig. 3 - DFN10 3 mm x 3 mm Package
Top View**

| PIN DESCRIPTION | | |
|-----------------|------------------|---|
| PIN NUMBER | NAME | FUNCTION |
| 1 | V_{IN} | Power input |
| 2 | V_{IN} | Power input |
| 3 | SS | Soft-Start pin. Connect a capacitor from SS to GND to program the soft-start time. Leave SS open to set the default soft-start time of 400 μ s. |
| 4 | EN | Enable input. Logic high enabled |
| 5 | I_{LIM} | Current limit setting pin. Connect R_{SET} resistor to GND |
| 6 | GND | Ground |
| 7 | \overline{PG} | Power Good |
| 8 | \overline{FLG} | Fault condition flag |
| 9 | V_{OUT} | Switch output |
| 10 | V_{OUT} | Switch output |
| Central Pad | | Connect this pad to GND or leave it floating |

Fig. 29 - SiP32419
Remains OFF after seeing Fault Condition

Fig. 31 - SiP32429
Re-Starts after ~ 150 ms during Fault Condition

**DETAILED DESCRIPTION****Over Current Limit**

When an over-current event occurs, the SiP32419 and SiP32429 will current limit immediately. If the event exceeds 7 ms the switch is turned OFF and the FLG pin is pulled low. The SiP32429 remains OFF for 150 ms and after this time if the signal on EN pin is in a high state, the switch will enable. The SiP32419 will remain OFF and can be reset by toggling V_{IN} or EN.

The current limit is set by connecting a resistor between the I_{LIM} pin and GND. R_{SET} can be calculated by the following formula:

$$I_{LIM} = \frac{1.24 \text{ V}}{R_{SET}} \times 5000$$

Where:

I_{LIM} = is the target current limit setting.

| R_{SET} SELECTION TABLE | | | | |
|--|--------------------------|-------------|-------------|-----------------|
| R_{SET} (kΩ) | CURRENT LIMIT (A) | | | TOL. (%) |
| | MIN. | TYP. | MAX. | |
| 1.74 | 2.85 | 3.56 | 4.28 | 20 |
| 1.78 | 2.78 | 3.48 | 4.18 | 20 |
| 1.82 | 2.73 | 3.41 | 4.09 | 20 |

| 8.25 | 0.56 | 0.75 | 0.94 | 25 |

Fig. 32 - Current Limit vs. R_{SET}

Soft Start

The soft start time can be calculated by the following formula:

$$\frac{\Delta V_{OUT}}{\Delta t} = \frac{I_{SS}}{C_{SS}} \times \frac{R_{OUT} \times 5000}{R_{SET}}$$

Where:

Δt is the soft start time

ΔV_{OUT} is the output voltage range

I_{SS} is the built-in current source charging the soft start capacitor C_{SS} . I_{SS} value is 5 μ A typical.

C_{SS} is the soft start time setting capacitor.

R_{SET} is the current limit setting resistor.

R_{OUT} is the output load.

Enable

The enable pin needs to be high for the device to become active. This can be accomplished by applying a logic high signal to the EN pin. Alternatively this pin can be hardwired through a resistor divider to the V_{IN} , thus keeping the switch permanently ON as long as the supply is present.

FLG

The \overline{FLG} is an open drain output and will be pulled low in fault condition. This pin can be pulled up through a 100K resistor.

PG

The \overline{PG} is an open drain output that will be pulled low when output voltage passes 90 % of the V_{IN} . This pin can be pulled up through a 100K resistor.

APPLICATION INFORMATION

Input Capacitor

While bypass capacitors at the inputs pins are not required, a 2.2 μF or larger capacitors for C_{IN} is recommended in almost all applications. The bypass capacitors should be placed as physically close to the device's input pins to be effective to minimize transients on the input. Ceramic capacitors are recommended over tantalum because of their ability to withstand input current surges from low impedance sources such as batteries.

Output Capacitor

The device does not require an output capacitor for proper operation. A proper value C_{OUT} is recommended to accommodate load transient per circuit design requirements. There are no ESR or capacitor type requirements.

Over Temperature Shutdown

In case an over temperature event happens, the SiP32419 and SiP32429 will turn the switch OFF immediately. The SiP32429 will then retry to start 150 ms after the temperature is back to normal; during this period, $\overline{\text{FLG}}$ will be pulled low. The SiP32429 $\overline{\text{FLG}}$ will be pulled high 150 ms after the OT event has finished. The SiP32419 will remain OFF and not retry to start, $\overline{\text{FLG}}$ will remain to be pulled low.

Thermal Consideration

SiP32419 and SiP32429 are designed to maintain a constant output load current. Due to physical limitations of the layout and assembly of the device the maximum switch current should be kept at reasonably safe level. However, another limiting characteristic of the safe operating load current is the thermal power dissipation.
