

0.9Ω, Low-Voltage, Single-Supply Quad SPST Analog Switches

General Description

The MAX4751/MAX4752/MAX4753 are low on-resistance, low-voltage, quad, single-pole/single-throw (SPST) analog switches that operate from a single +1.6V to +3.6V supply. These devices have fast switching speeds ($t_{ON} = 30\text{ns}$, $t_{OFF} = 25\text{ns}$), handle rail-to-rail analog signals, and consume less than $1\mu\text{W}$ of quiescent power. The MAX4753 has break-before-make switching.

When powered from a +3V supply, the MAX4751/MAX4752/MAX4753 feature low 0.9Ω (max) on-resistance (R_{ON}), with 0.12Ω (max) R_{ON} matching and 0.1Ω (max) R_{ON} flatness. The digital input is 1.8V CMOS compatible when using a single +3V supply.

The MAX4751 has four normally open (NO) switches, the MAX4752 has four normally closed (NC) switches, and the MAX4753 has two NO and two NC switches. The MAX4751/MAX4752/MAX4753 are available in $3\text{mm} \times 3\text{mm}$, 16-pin QFN and 14-pin TSSOP packages.

Applications

Power Routing
 Battery-Powered Systems
 Audio and Video Signal Routing
 Low-Voltage Data-Acquisition Systems
 Communications Circuits
 PCMCIA Cards
 Cellular Phones
 Modems
 Hard Drives

Features

- ◆ **Low R_{ON}**
 0.9Ω max (+3V Supply)
 2.5Ω max (+1.8V Supply)
- ◆ **On-Resistance Flatness: 0.1Ω max (+3V)**
- ◆ **R_{ON} Matching**
 0.12Ω max (+3V Supply)
 0.25Ω max (+1.8V Supply)
- ◆ **+1.6V to +3.6V Single-Supply Operation**
- ◆ **Available in 16-Pin QFN and $3\text{mm} \times 3\text{mm}$ Packages**
- ◆ **1.8V CMOS Logic Compatible (+3V Supply)**
- ◆ **High Current-Handling Capacity (100mA Continuous)**
- ◆ **Fast Switching: $t_{ON} = 30\text{ns}$, $t_{OFF} = 25\text{ns}$**

ABSOLUTE MAXIMUM RATINGS

(Voltages referenced to GND.)

V+, IN_-0.3V to +4V

COM_, NO_, NC_ (Note 1)-0.3V to (V+ + 0.3V)

Continuous Current (COM_, NO_, NC_)±100mA

Peak Current COM_, NO_, NC_ (pulsed at 1ms 10% duty cycle)±200mA

Continuous Power Dissipation (T_A = +70°C)

TSSOP (derate 9.1W/°C above +70°C)727mW

QFN (derate 16.9W/°C above +70°C)1349mW

Operating Temperature Range-40°C to +85°C

Junction Temperature+150°C

Storage Temperature Range-65°C to +150°C

Lead Temperature (soldering, 10s)+300°C

Soldering Temperature (reflow)+260°C

Note 1: Signals on COM_, NO_, or NC_ exceeding V+ or GND are clamped by internal diodes. Limit forward diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2: The algebraic convention is used in this data sheet; the most negative value is shown in the minimum column.

Note 3: Parts are tested at +85°C and guaranteed by design and correlation over the full temperature range.

Note 4: R_{ON} and ΔR_{ON} matching specifications for QFN-packaged parts are guaranteed by design.

Note 5: ΔR_{ON} = R_{ON}(MAX) - R_{ON}(MIN)

Note 6: Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal ranges.

Note 7: Leakage parameters are 100% tested at the maximum-rated hot operating temperature and guaranteed by correlation at T_A = +25°C.

Note 8: Guaranteed by design, not production tested.

Note 9: Off-Isolation = 20log₁₀[V_{COM} / (V_{NC} or V_{NO})], V_{COM} = output, V_{NC} or V_{NO} = input to off switch.

AS REQUIRED

1MHz CAPACITANCE ANALYZER

The diagram shows a MAX4751/52/53 switch component with pins V+, NO_OR_NC_, COM_, and GND. A voltage source V+ is connected to the V+ pin through a 0.1 μF capacitor. The IN_ pin is connected to a switch that can route the signal to either COM_ or NO_OR_NC_. The NO_OR_NC_ pin is connected to a network analyzer through a 50 Ω resistor. The COM_ pin is connected to ground through a 50 Ω resistor. The network analyzer is configured with a 50 Ω input impedance, a 50 Ω output impedance, and a 50 Ω termination at the output. The output of the network analyzer is connected to a 50 Ω termination. The input to the network analyzer is labeled V_IN and the output is labeled V_OUT.

MEASUREMENTS ARE STANDARDIZED AGAINST SHORT AT SOCKET TERMINALS. OFF-ISOLATION IS MEASURED BETWEEN COM AND "OFF" TERMINAL ON EACH SWITCH. ON-LOSS IS MEASURED BETWEEN COM AND "ON" TERMINAL ON EACH SWITCH. SIGNAL DIRECTION THROUGH SWITCH IS REVERSED; WORST VALUES ARE RECORDED.

OFF-ISOLATION = $20 \log \frac{V_{OUT}}{V_{IN}}$

ON-LOSS = $20 \log \frac{V_{OUT}}{V_{IN}}$

*ADD 50 Ω TERMINATION FOR OFF-ISOLATION

Maxim Integrated

MAX4751/MAX4752/MAX4753

0.9 Ω , Low-Voltage, Single-Supply Quad SPST Analog Switches

Detailed Description

The MAX4751/MAX4752/MAX4753 are low 0.9 Ω max (at $V_+ = 3V$) on-resistance, low-voltage quad analog switches that operate from a +1.6V to +3.6V single supply. CMOS construction allows switching analog signals that are within the supply voltage range (GND to V_+).

When powered from a +3V supply, the 0.9 Ω (max) R_{ON} allows high continuous currents to be switched in a variety of applications.

Applications Information

Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings because stresses beyond the listed ratings can cause permanent damage to the devices. Always sequence V_+ on first, followed by NO_+ , NC_+ , or COM_+ . If power-supply sequencing is not possible, add two small-signal diodes ($D1$, $D2$) in series with the supply pins for overvoltage protection (Figure 5). Adding these diodes reduces the analog signal by one diode drop below V_+ and one diode drop above GND, but does not affect the low switch resistance and low leakage characteristics of the device. Device operation is unchanged, and the difference between V_+ and GND should not exceed 4V.

Power-supply bypassing is needed to improve noise margin and to prevent switching noise propagation from the V_+ supply to other components. A 0.1 μF capacitor, connected from V_+ to GND, is adequate for most applications.

Logic Inputs

The MAX4751/MAX4752/MAX4753 logic inputs can be driven up to +3.6V regardless of the supply voltage. For example, with a +1.8V supply, IN_+ may be driven low to GND and high to +3.6V. Driving IN_+ rail-to-rail minimizes power consumption.

Analog Signal Levels

Analog signals that range over the entire supply voltage (V_+ to GND) can be passed with very little change in on-

Figure 5. Overvoltage Protection Using Two External Blocking Diodes

resistance (see the *Typical Operating Characteristics*). The switches are bidirectional, so the NO_+ , NC_+ , and COM_+ pins can be used as either inputs or outputs.

Layout

High-speed switches require proper layout and design procedures for optimum performance. Reduce stray inductance and capacitance by keeping traces short and wide. Ensure that bypass capacitors are as close to the device as possible. Use large ground planes where possible.
