

DATA SHEET

AAT4687: Over-Voltage Protection Switch

Applications

- Cell phones
- Digital still cameras
- GPS
- MP3 players
- Personal data assistants (PDAs)
- USB hot-swap/live-insertion devices

Features

- Over-voltage protection up to 28 V
- Fixed or adjustable over-voltage protection threshold
- 3 V under-voltage lockout threshold
- Fast OVP response:
 - 0.7 μ s typical to over-voltage transient
- Low operation quiescent current:
 - 30 μ A typical
 - 1 μ A max in shutdown (disabled)
- Thermal shutdown protection
- 100 m Ω typical (130 m Ω Max.) $R_{DS(ON)}$ at 5 V
- OVP, OTP fault indicator
- 1.8 A maximum continuous current
- Temperature range: –40 °C to +85 °C
- SC70JW (10-pin, 2.2 mm \times 2.0 mm) package (MSL1, 260 °C per JEDEC J-STD-020)

Skyworks Green™ products are compliant with all applicable legislation and are halogen-free. For additional information, refer to *Skyworks Definition of Green™*, document number SQ04-0074.

Description

The AAT4687 OVPSwitch™ is a member of the Skyworks Application Specific Power MOSFET (ASPM™) product family. It is a P-channel MOSFET power switch with precise over-voltage protection control, designed to protect low-voltage systems against high-voltage faults up to +28 V. If the input voltage exceeds the programmed over-voltage threshold, the P-channel MOSFET switch is turned off to prevent damage to the output load circuits. The AAT4687 is available with an internally programmed over-voltage trip point or as an adjustable version programmed by two external resistors.

The AAT4687 includes an under-voltage lockout (UVLO) protection circuit, which puts the device into sleep mode at low input voltages, consuming less than 1 μ A of current. The AAT4687 also includes an enable pin (\overline{EN}) to enable or disable the device and an OVP, OTP fault indicator (\overline{FLT}).

The AAT4687 is offered in a small 10-pin, 2.2 mm \times 2.0 mm SC70JW package, and is specified for operation over the –40 °C to +85 °C ambient temperature range.

A typical application circuit is shown in Figure 1. The pin configurations are shown in Figure 2. Signal pin assignments and functional pin descriptions are provided in Table 1.

Figure 1. AAT4687 Typical Application Circuit

Figure 2. AAT4687 Pinout – 10-Pin, 2.2 mm × 2.0 mm SC70JW (Top View)

Table 1. AAT4687 Signal Descriptions

Pin Number		Name	Description
Adjustable	Fixed		
1	N/C	OVP	Over-voltage protection threshold input (adjustable only). In the fixed version, this pin is not connected.
2, 8, 9, 10		GND	Ground connection pin.
3		FLT	Over-voltage or over-temperature fault reporting output pin. Open drain. FLT goes low when input voltage exceeds the over-voltage threshold or an over-temperature fault occurs. An external pull up resistor to Vio (6.5 V max) should be added.
4		EN	Enable input pin, active low. An internal pull-down resistor is connected on this pin. Connect to ground for normal operation. Connect to high (6.5 V Max) to shut down the device, which then draws less than 1 μ A of current.
5		IN	Power input pin. Connect 1 μ F capacitor from IN to GND.
6, 7		OUT	Output. Connect a 0.1 μ F ~ 47 μ F capacitor from OUT to GND.

Electrical and Mechanical Specifications

The absolute maximum ratings of the AAT4687 are provided in Table 2, the thermal information is listed in Table 3, and electrical specifications are provided in Table 4.

Typical performance characteristics of the AAT4687 are shown in Figures 3 through 20

Table 2. AAT4687 Absolute Maximum Ratings (Note 1)

Parameter	Symbol	Minimum	Maximum	Units
IN to GND	VIN	−0.3	+30	V
OVP to GND	VOVP	−0.3	+6.5	V
FLT, EN to GND	VFLT, VEN	−0.3	+6.5	V
OUT to GND	VOUT	−0.3	VIN + 0.3	V
Maximum continuous switch current	IMAX		1.8	A
Operating junction temperature range	TJ	−40	150	°C
Storage temperature	TSTG	−40	150	°C
Maximum soldering temperature (at leads)	TLEAD		300	°C

Note 1: Exposure to maximum rating conditions for extended periods may reduce device reliability. There is no damage to device with only one parameter set at the limit and all other parameters set at or below their nominal value. Exceeding any of the limits listed may result in permanent damage to the device.

Table 3. AAT4687 Thermal Information

Parameter	Symbol	Value	Units
Maximum thermal resistance (Note 1)	θ_{JA}	160	°C/W
Maximum power dissipation (Note 1, Note 2)	Pd	625	mW

Note 1: Mounted on an FR4 board.

Note 2: Derate 6.25 mW/°C above 25 °C.

CAUTION: Although this device is designed to be as robust as possible, electrostatic discharge (ESD) can damage this device. This device must be protected at all times from ESD. Static charges may easily produce potentials of several kilovolts on the human body or equipment, which can discharge without detection. Industry-standard ESD precautions should be used at all times.

Table 4. AAT4687 Electrical Specifications (Note 1)

(VIN = 5 V, TA = –40 °C to +85°C, Unless Otherwise Noted, Typical Values are TA = 25 °C)

Parameter	Symbol	Test Condition	Min	Typical	Max	Units
Input over-voltage protection range	VIN_MAX				28	V
Normal operating input voltage range	VIN		3		14	V
Operation quiescent current	Iq	VIN = 5 V, \overline{EN} = 0 V, IOUT = 0 A		30	60	μA
Shutdown supply current	ISD(OFF)	\overline{EN} = VIN, VIN = 5.5 V, VOUT = 0 V			1	μA

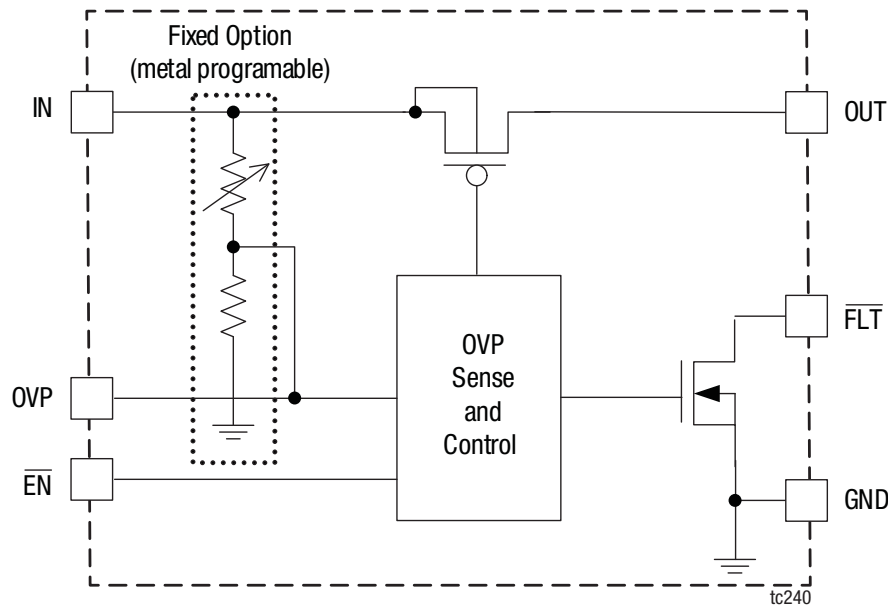

Figure 21. AAT4687 Functional Block Diagram

Functional Description

The AAT4687 provides up to 28 V over-voltage protection when powering low-voltage systems such as cell phones, MP3 players, and PDAs or when charging Lithium-Ion batteries from a poorly regulated supply. The AAT4687 is inserted between the power supply or charger source and the load to be protected. The AAT4687 IC includes a low-resistance P-channel MOSFET, under-voltage lockout protection, over-voltage monitor, fast shut-down circuitry, and a fault output flag.

In normal operation, the P-channel MOSFET acts as a slew-rate controlled load switch, connecting and disconnecting the power supply from IN to OUT. A low-resistance MOSFET is used to minimize the voltage drop between the voltage source and the load and to reduce power dissipation. When the voltage on the input exceeds the over-voltage protection trip voltage (internally set in the fixed voltage version or externally by a voltage divider to the OVP pin for the adjustable version), the device immediately turns off the internal P-channel FET, disconnecting the load from the input and preventing damage to downstream components. Simultaneously, the fault flag is raised, alerting the system to a problem.

If an over-voltage condition is applied at the time of the device enable, then the switch will remain OFF.

A functional block diagram is shown in Figure 21. Figure 22 shows the timing diagram.

Under-Voltage Lockout (UVLO)

The AAT4687 has a fixed 3.0 V under-voltage lockout level (UVLO). When the input voltage is less than the UVLO level, the

MOSFET is turned off. Hysteresis of 100 mV is included to ensure circuit stability.

Over-Voltage Protection (OVP)

The AAT4687 adjustable version has a $1.1 \text{ V} \pm 1.5\%$ over-voltage trip threshold on the OVP pin. With a resistor divider on the OVP pin from IN to GND, the over-voltage trip point can be adjusted anywhere within the input voltage range (see Table 5). Once the over-voltage trip level is triggered, the PMOS switch controller will turn off the PMOS in less than $0.7 \mu\text{s}$.

In the AAT4687 fixed version, the resistor divider is internally integrated with the input voltage trip point at 6.5 V. The fixed version of the AAT4687 does not have a connection to the internal OVP circuitry, and Pin 1 is designed to be left unconnected.

Over-Temperature Protection (OTP)

If the ambient temperature of the device exceeds T_{SHDN} , the OVP switch is turned off, and the pin is driven low. The OVP switch recovers automatically when the junction temperature falls below $(T_{SHDN} - 20^\circ\text{C})$.

Fault Indicator (FLT)

The output is an active-low open-drain fault reporting output. A pull-up resistor should be connected from FLT to the logic I/O voltage of the host system. FLT is asserted immediately if an over-voltage or over-temperature fault occurs.

Figure 22. AAT4687 Timing Diagram

Enable Control ($\overline{\text{EN}}$)

$\overline{\text{EN}}$ is an active-low enable input. $\overline{\text{EN}}$ is driven low, connected to ground, or left floating for normal device operation. Taking $\overline{\text{EN}}$ high turns off the MOSFET. In case of an over-voltage or UVLO condition, toggling $\overline{\text{EN}}$ does not override the fault condition and the switch remains off.

Device Operation

On initial power-up, if $V_{\text{IN}} < V_{\text{UVLO}}$ or if $V_{\text{OVP}} > V_{\text{OVP_TH}}$ (1.1 V), the PMOS is held off. If $V_{\text{UVLO}} < V_{\text{IN}}$, $V_{\text{OVP}} < V_{\text{OVP_TH}}$, and $\overline{\text{EN}}$ is low, the device enters startup after a 10 ms internal delay.

Application Information

Over-Voltage Protection

The AAT4687 over-voltage protection circuit provides fast protection against transient voltage spikes and short duration spikes of high voltage from the power supply lines. The AAT4687 can quickly disconnect the input supply from the load and avoid damage to sensitive components.

In portable product applications, removing the battery pack during charging can create large transients, and a high voltage spike can occur which can damage other electronic components (such as the battery charger) in the product. A "hot plug" of the AC/DC wall adapter into the AC outlet can create and release a voltage spike from the transformer. As a result, some sensitive components within the product can be damaged. When the AAT4687 is placed between the power lines

and the sensitive devices, they are insulated from the voltage spike, and the input supply is disconnected in 0.7 μs .

Figure 23 shows the over-voltage protection response time test circuit, with $R1 = 487 \text{ k}\Omega$, $R2 = 110 \text{ k}\Omega$, $C_{\text{OUT}} = 1 \text{ }\mu\text{F}$ and $R_{\text{OUT}} = 10 \text{ }\Omega$. Figure 24 is the typical over-voltage response time curve. The input voltage is rapidly increased from 5 V to 12 V by a voltage surge or voltage spike. The voltage at the OVP pin is also increased until it reaches the over-voltage trip point. At this point, the $\overline{\text{FLT}}$ pin is pulled low and the output voltage starts to fall. Figure 25 shows a zoom-in scope capture of the OVP response time; the output is disconnected from the input in as little as 0.7 μs .

Adjustable Version - Over-Voltage Protection Resistors

The over-voltage protection threshold is programmed with two resistors: $R1$ and $R2$. To limit current flow through the external resistor string while maintaining good noise immunity, use smaller resistor values, such as 10 $\text{k}\Omega$ for $R2$. Using a larger value further reduces system current, but also increases the impedance of the OVP node, making it more sensitive to external noise and interference. A suggested value for $R2$ is 110 $\text{k}\Omega$. In the case of $R2 = 110 \text{ k}\Omega$ and $V_{\text{OVP_TH}} = 1.1 \text{ V}$, $R1$ can be approximated by the following formula:

$$R1 = \left(\frac{V_{\text{OVPT}}}{V_{\text{OVP_TH}}} - 1 \right) \times R2 = \left(\frac{V_{\text{OVPT}}}{1.1} - 1 \right) \times 110$$

Where the voltage is in V, resistance in $\text{k}\Omega$.

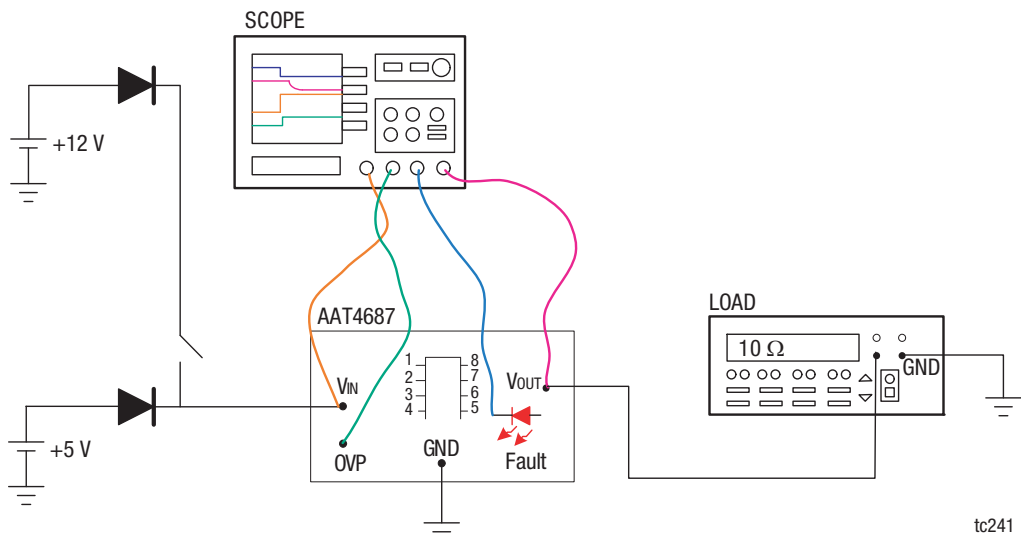

Figure 23. Over-Voltage Protection Response Time Test Circuit

Figure 24. Typical Over-Voltage Response Time

Figure 25. Typical Over-Voltage Response (Zoom View)

Table 5 summarizes resistor values for various over-voltage settings. Use 1% tolerance metal film resistors for programming the desired OVP setting.

Table 5. Recommended OVP Setting for the Adjustable Version

R2 (kΩ)	R1 (kΩ)	Vovpr Setting (V)

110	2550	26.5

Input Capacitor

A 1 μF or larger capacitor is typically recommended for C_{IN} . C_{IN} should be located as close to the device VIN pin as practically possible. Ceramic, tantalum, or aluminum electrolytic capacitors may be selected for C_{IN} . There is no specific capacitor equivalent series resistance (ESR) requirement for C_{IN} . However, for higher current operation, ceramic capacitors are recommended for C_{IN} due to their inherent capability over tantalum capacitors to withstand input current surges from low impedance sources such as batteries in portable devices.

Capacitors are typically manufactured in different voltage ratings. If the maximum possible surge voltage is known, select capacitors with a voltage rating at least 5 V higher than the maximum possible surge voltage. Otherwise, 50 V rated capacitors are generally good for most OVP applications to prevent any surge voltage.

Output Capacitor

A 0.1 μF ~ 47 μF output capacitor is required at the output. Likewise, with the output capacitor, there is no specific capacitor ESR requirement. C_{OUT} may be increased to accommodate any load transient condition.

Thermal Considerations and Maximum Output Current

The AAT4687 is designed to deliver a continuous output load current. The limiting characteristic for maximum safe operating output load current is package power dissipation. In order to obtain high operating currents, careful device layout and circuit operating conditions must be taken into account. The following description assumes the load switch is mounted on a printed circuit board utilizing the minimum recommended footprint in the *Printed Circuit Board Layout Recommendations* section. At any given ambient temperature (T_A), the maximum package power dissipation can be determined by the following equation:

$$P_{D(\text{MAX})} = \frac{T_{J(\text{MAX})} - T_A}{\theta_{JA}}$$

Constants for the AAT4687 are maximum junction temperature ($T_{J(\text{MAX})} = +125^\circ\text{C}$) and package thermal resistance ($\theta_{JA} = 160^\circ\text{C/W}$). Worst-case conditions are calculated at the maximum operating temperature, $T_A = +85^\circ\text{C}$. Typical conditions are calculated under normal ambient conditions

where $T_A = +25^\circ\text{C}$. At $T_A = +85^\circ\text{C}$, $P_{D(\text{MAX})} = 250\text{ mW}$. At $T_A = +25^\circ\text{C}$, $P_{D(\text{MAX})} = 625\text{ mW}$.

The maximum continuous output current for the AAT4687 is a function of the package power dissipation and the R_{DS} of the MOSFET at $T_{J(\text{MAX})}$. The maximum R_{DS} of the MOSFET at $T_{J(\text{MAX})}$ is calculated by increasing the maximum room temperature.

For maximum current, refer to the following equation:

$$I_{OUT(\text{MAX})} = \sqrt{\frac{P_{D(\text{MAX})}}{R_{\text{DS}}}}$$

The maximum allowable output current for the AAT4687 is 1.8 A. If the output current exceeds 1.8 A, the device is damaged.

Printed Circuit Board Layout Recommendations

For proper thermal management and to take advantage of the low $R_{\text{DS(ON)}}$ of the AAT4687, certain circuit board layout rules should be followed:

- VIN and VOUT should be routed using wider than normal traces, and GND should be connected to a ground plane.
- To maximize package thermal dissipation and power handling capacity of the AAT4687 SC70JW-10 package, the ground plane area connected to the ground pins should be as large as possible.
- For best performance, C_{IN} and C_{OUT} should be placed close to the package pins.

Evaluation Board Description

The AAT4687 Evaluation Board is used to test the performance of the AAT4687. An Evaluation Board schematic diagram is provided in Figure 26. Layer details for the Evaluation Board are shown in Figure 27. The Evaluation Board has additional components for easy evaluation, and the bill of materials required for the system is shown in Table 6.

Package Information

Package dimensions for the 10-pin SC70JW package are shown in Figure 28. Tape and reel dimensions are shown in Figure 29.
