

# 800Mbps LVDS/LVPECL-to-LVDS 2 x 2 Crosspoint Switch

**MAX9152**

## General Description

The MAX9152 2 x 2 crosspoint switch is designed for applications requiring high speed, low power, and low-noise signal distribution. This device includes two LVDS/LVPECL inputs, two LVDS outputs, and two logic inputs that set the internal connections between differential inputs and outputs.

The MAX9152 can be programmed to connect any input to either or both outputs, allowing it to be used in the following configurations: 2 x 2 crosspoint switch, 2:1 mux, 1:2 demux, 1:2 splitter, or dual repeater. This flexibility makes the MAX9152 ideal for protection switching in fault-tolerant systems, loopback switching for diagnostics, fanout buffering for clock/data distribution, and signal regeneration for communication over extended distances.

Ultra-low 120ps<sub>PK-PK</sub> (max) PRBS jitter ensures reliable communications in high-speed links that are highly sensitive to timing error, especially those incorporating clock-and-data recovery, or serializers and deserializers. The high-speed switching performance guarantees an 800Mbps data rate and less than 50ps (max) skew between channels.

LVDS inputs and outputs are compatible with the TIA/EIA-644 LVDS standard. The LVDS inputs are designed to also accept LVPECL signals directly, and PECL signals with an attenuation network. The LVDS outputs are designed to drive 75Ω or 100Ω loads, and feature a selectable differential output resistance to minimize reflections.

The MAX9152 is available in 16-pin TSSOP and SO packages, and consumes only 109mW while operating from a single +3.3V supply over the -40°C to +85°C temperature range.

## Applications

- Cell Phone Base Stations
- Add/Drop Muxes
- Digital Crossconnects
- DSLAMs
- Network Switches/Routers
- Protection Switching
- Loopback Diagnostics
- Clock/Data Distribution
- Cable Repeaters

## Features

- ◆ **Pin-Programmable Configuration**
  - 2 x 2 Crosspoint Switch
  - 2:1 Mux
  - 1:2 Demux
  - 1:2 Splitter
  - Dual Repeater
- ◆ **Ultra-Low 120ps<sub>PK-PK</sub> (max) Jitter with 800Mbps, PRBS = 2<sup>23</sup> -1 Data Pattern**
- ◆ **Low 50ps (max) Channel-to-Channel Skew**
- ◆ **109mW Power Dissipation**
- ◆ **Compatible with ANSI TIA/EIA-644 LVDS Standard**
- ◆ **Inputs Accept LVDS/LVPECL Signals**
- ◆ **LVDS Output Rated for 75Ω and 100Ω Loads**
- ◆ **Pin-Programmable Differential Output Resistance**
- ◆ **Pin-Compatible Upgrade to DS90CP22 (SO Package)**
- ◆ **Available in 16-Pin TSSOP Package (Half the Size of SO)**

## Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE
MAX9152ESE	-40°C to +85°C	16 SO
MAX9152EUE	-40°C to +85°C	16 TSSOP

*Pin Configuration appears at end of data sheet.*

## Functional Diagram

# 800Mbps LVDS/LVPECL-to-LVDS 2 x 2 Crosspoint Switch

## ABSOLUTE MAXIMUM RATINGS

V<sub>CC</sub> to GND .....-0.3V to +4.0V  
 IN<sub>+</sub>, IN<sub>-</sub>, OUT<sub>+</sub>, OUT<sub>-</sub> to GND .....-0.3V to +4.0V  
 EN<sub>-</sub>, SEL<sub>-</sub>, NC/RSEL to GND .....-0.3V to (V<sub>CC</sub> + 0.3V)  
 Short-Circuit Duration (OUT<sub>+</sub>, OUT<sub>-</sub>) .....Continuous  
 Continuous Power Dissipation (T<sub>A</sub> = +70°C)  
     16-Pin SO (derate 8.7mW/°C above +70°C) .....696mW  
     16-Pin TSSOP (derate 9.4mW/°C above +70°C) .....755mW

Storage Temperature Range .....-65°C to +150°C  
 Junction Temperature .....+150°C  
 Operating Temperature Range .....-40°C to +85°C  
 Lead Temperature (soldering, 10s) .....+300°C  
 ESD Protection  
     Human Body Model, IN<sub>+</sub>, IN<sub>-</sub>, OUT<sub>+</sub>, OUT<sub>-</sub> ..... ±7kV

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## DC ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = +3.0V to +3.6V, NC/RSEL = open for R<sub>L</sub> = 75Ω ±1%, NC/RSEL = high for R<sub>L</sub> = 100Ω ±1%, differential input voltage |V<sub>ID</sub>| = 0.1V to V<sub>CC</sub>, input voltage (V<sub>IN+</sub>, V<sub>IN-</sub>) = 0 to V<sub>CC</sub>, EN<sub>-</sub> = high, SEL0 = low, SEL1 = high, and T<sub>A</sub> = -40°C to +85°C. ( $V_{CC} = +3.3V$ ,  $R_L = 100\Omega$ , NC/RSEL = high,  $C_L = 5pF$ , input transition time = 600ps (20% to 80%),  $V_{ID} = 200mV$ , PRBS =  $2^{23} - 1$  data pattern,  $V_{CM} = +1.2V$ ,  $T_A = +25^\circ C$ , unless otherwise noted.)

MAX9152

# 800Mbps LVDS/LVPECL-to-LVDS 2 x 2 Crosspoint Switch

## Pin Description

PIN	NAME	FUNCTION
1, 2	SEL1, SEL0	LVC MOS/LVTTL Logic Inputs. Allow the switch to be configured as a mux, repeater, or splitter.
3, 4	IN0+, IN0-	LVDS/LVPECL Differential Input 0
5	V <sub>CC</sub>	Power-Supply Input. Bypass V <sub>CC</sub> to GND with 0.1μF and 0.001μF ceramic capacitors.
6, 7	IN1+, IN1-	LVDS/LVPECL Differential Input 1
8	NC/RSEL	Logic Input. Selects differential output resistance. Set NC/RSEL to open or low when R <sub>L</sub> = 75Ω, set to high when R <sub>L</sub> = 100Ω.
9	NC	No Connect
10, 11	OUT1-, OUT1+	LVDS Differential Output 1
12	GND	Ground
13, 14	OUT0-, OUT0+	LVDS Differential Output 0
15, 16	EN1, EN0	LVC MOS/LVTTL Logic Inputs. Enables or disables the outputs. Setting EN0 or EN1 high enables the corresponding output, OUT0 or OUT1. Setting EN0 or EN1 low puts the corresponding output into high impedance (differential output resistance is also high impedance).

## Detailed Description

The LVDS interface standard is a signaling method intended for point-to-point communication over a controlled impedance medium as defined by the ANSI TIA/EIA-644 and IEEE 1596.3 standards. LVDS uses a lower voltage swing than other common communication standards, achieving higher data rates with reduced power consumption while reducing EMI emissions and system susceptibility to noise.

The MAX9152 is an 800Mbps 2 x 2 crosspoint switch designed for high-speed, low-power point-to-point and multidrop interfaces. The device accepts LVDS or differential LVPECL signals and routes them to outputs depending on the selected mode of operation.

A differential input with a magnitude of 0.1V to V<sub>CC</sub> with single-ended voltage levels at or within the MAX9152's V<sub>CC</sub> and ground switches the output. A differential input with a magnitude of at least 0.15V with single-ended voltage levels at or within the MAX9152's V<sub>CC</sub> and ground is required to meet the AC specifications.

In the 1:2 splitter mode, the outputs repeat the selected input. This is useful for distributing a signal or creating a copy for use in protection switching. In the repeater

Figure 1. Test Circuit for V<sub>OD</sub> and V<sub>OS</sub>

mode, the device operates as a two-channel buffer. Repeating restores signal amplitude, allowing isolation of media segments or longer media drive. The device is a crosspoint switch where any input can be connected to any output or outputs. In 2:1 mux mode, primary and backup signals can be selected to provide a protection-switched, fault-tolerant application.

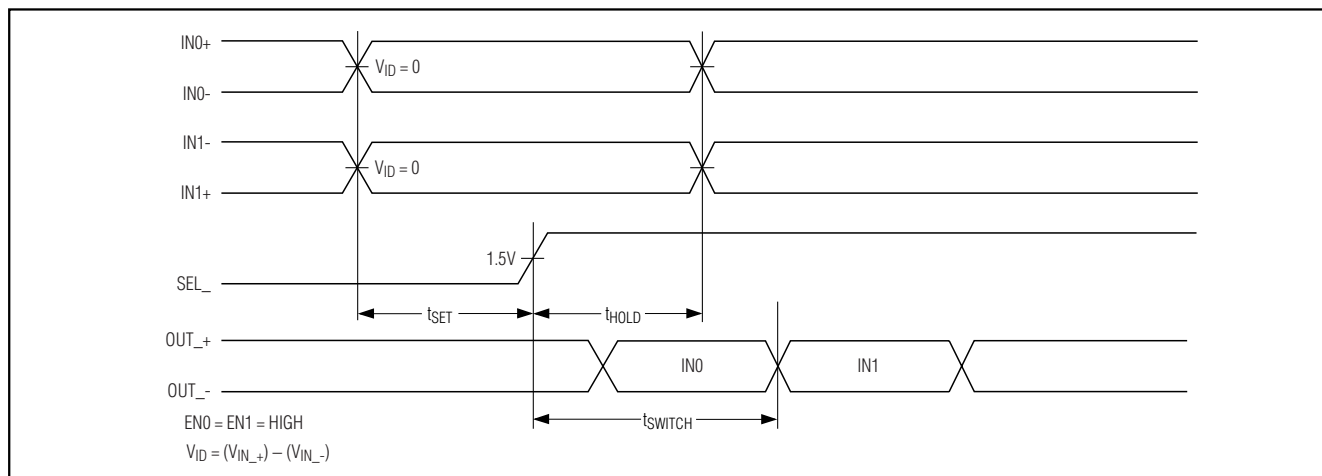

Figure 2. Input to Rising Edge Select Setup, Hold, and Mux Switch Timing Diagram

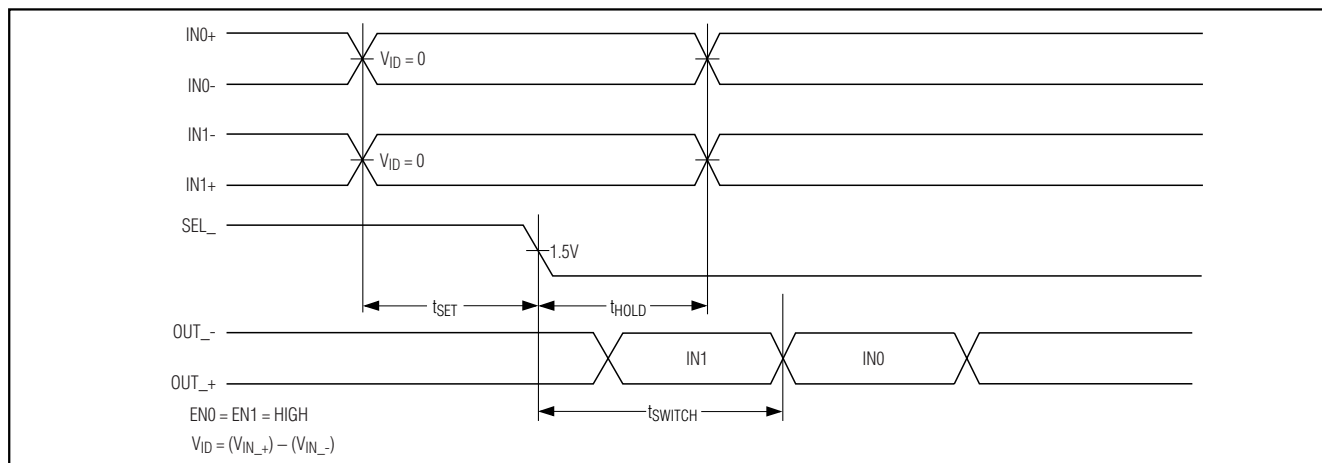

Figure 3. Input to Falling Edge Select Setup, Hold, and Mux Switch Timing Diagram

### Input Fail-Safe

The differential inputs of the MAX9152 do not have internal fail-safe biasing. If fail-safe biasing is required, it can be implemented with external large-value resistors.  $IN_+$  should be pulled up to  $V_{CC}$  with  $10k\Omega$  and  $IN_-$  should be pulled down to GND with  $10k\Omega$ . The voltage-divider formed by the  $10k\Omega$  resistors and the  $100\Omega$  termination resistor (across  $IN_+$  and  $IN_-$ ) provides a slight positive differential bias and sets a high state at the device output when inputs are undriven.

### Output Resistance

The MAX9152 has a selectable differential output resistance to reduce reflections from impedance discontinuities in the interconnect. Reflections are reduced,

compared to a high-impedance output. A termination resistor at the receiver is still required and is the primary termination for the interconnect. Select the output resistance that best matches the differential characteristic impedance of the interconnect used.

### Select Function

The SEL0 and SEL1 logic inputs allow the device to be configured as a high-speed differential crosspoint, 2:1 mux, 1:2 demux, dual repeater, or 1:2 splitter (Figure 8). See Table 1 for mode selection settings.

### Enable Function

The EN0 and EN1 logic inputs enable and disable driver outputs OUT0 and OUT1. Setting EN0 or EN1 high enables the corresponding driver output. Setting EN0

# 800Mbps LVDS/LVPECL-to-LVDS 2 x 2 Crosspoint Switch

or EN1 low puts the corresponding driver output into a high-impedance state (the differential output resistance also becomes high impedance).

Figure 4. Output Active to High-Z and High-Z to Active Test Circuit and Timing Diagram

Table 1. Input/Output Function Table

SEL0	SEL1	OUT0	OUT1	MODE
L	L	IN0	IN0	1:2 splitter
L	H	IN0	IN1	Repeater
H	L	IN1	IN0	Switch
H	H	IN1	IN1	1:2 splitter

## Applications Information

### Unused Differential Inputs

Unused differential inputs should be tied to ground and  $V_{CC}$  to prevent the high-speed input stage from switching due to noise.  $IN_+$  should be pulled to  $V_{CC}$  with  $10k\Omega$  and  $IN_-$  should be pulled to GND with  $10k\Omega$ .

### Expanding the Number of LVDS Output Ports

Devices can be cascaded to make larger switches. Total propagation delay and total jitter should be considered to determine the maximum allowable switch size. Three MAX9152s are needed to make a 2 input x 4 output crosspoint switch with two device propagation delays. Seven MAX9152s make a 2 input x 8 output crosspoint with three device delays.

### Accepting PECL Inputs

The inputs accept PECL signals with the use of an attenuation circuit, as shown in Figure 9.

### Power-Supply Bypassing

Bypass  $V_{CC}$  to ground with high-frequency surface-mount ceramic  $0.1\mu F$  and  $0.001\mu F$  capacitors in paral-

Figure 5. Output Transition Time, Propagation Delay, and Output Channel-to-Channel Skew Test Circuit

# 800Mbps LVDS/LVPECL-to-LVDS 2 x 2 Crosspoint Switch

MAX9152

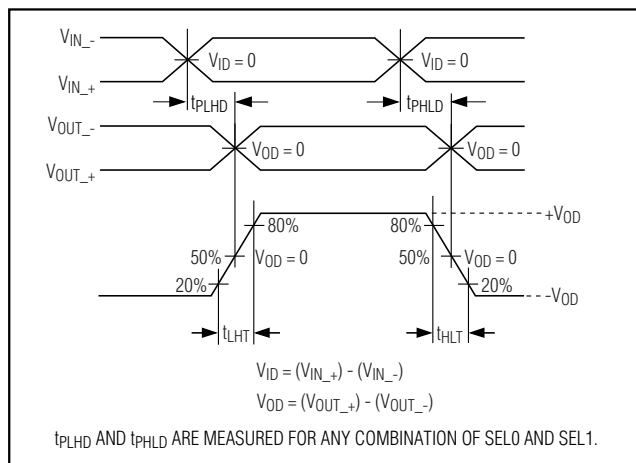

Figure 6. Output Transition Time and Propagation Delay Timing Diagram

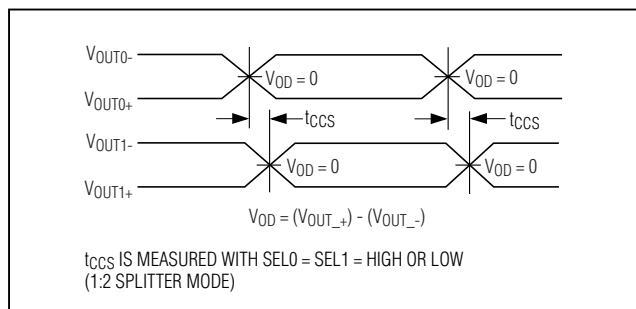

Figure 7. Output Channel-to-Channel Skew

lel as close to the device as possible, with the smaller value capacitor closest to  $V_{CC}$ .

## Differential Traces

Trace characteristics affect the performance of the MAX9152. Use controlled-impedance traces. Eliminate reflections and ensure that noise couples as common mode by running the differential trace pairs close together. Reduce skew by matching the electrical length of the traces. Excessive skew can result in a degradation of magnetic field cancellation.

Maintain the distance between the differential traces to avoid discontinuities in differential impedance. Avoid 90° turns and minimize the number of vias to further prevent impedance discontinuities.

## Cables and Connectors

Transmission media should have nominal differential impedance of 75Ω or 100Ω. Use cables and connectors that have matched differential impedance to minimize impedance discontinuities.

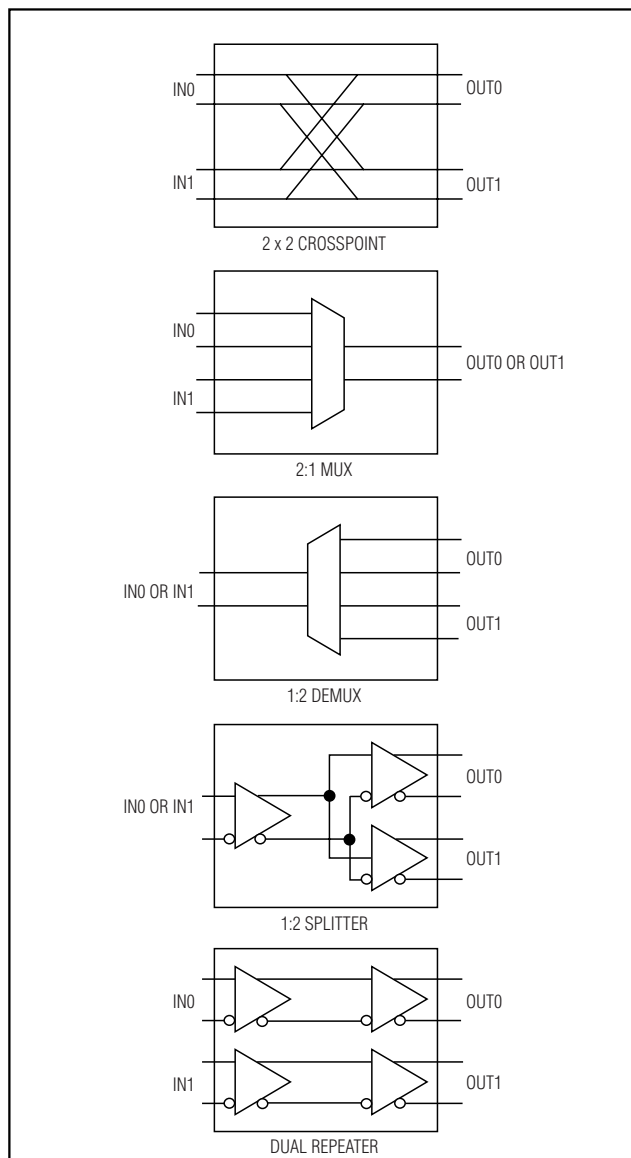

Figure 8. Programmable Configurations

Avoid the use of unbalanced cables such as ribbon or simple coaxial cable. Balanced cables such as twisted pair offer superior signal quality and tend to generate less EMI due to canceling effects. Balanced cables tend to pick up noise as common mode, which is rejected by the differential receiver.

## Board Layout

For LVDS applications, a four-layer printed-circuit (PC) board that provides separate power, ground, and signal planes is recommended.
