

## Features

- Very high speed: 45 ns
  - Wide voltage range: 2.20 V to 3.60 V
- Temperature range:
  - Industrial: -40 °C to +85 °C
  - Automotive-A: -40 °C to +85 °C
- Pin compatible with CY62148DV30
- Ultra low standby power
  - Typical standby current: 1 μA
  - Maximum standby current: 7 μA (Industrial)
- Ultra low active power
  - Typical active current: 2 mA at f = 1 MHz
- Easy memory expansion with  $\overline{CE}$  and  $\overline{OE}$  features
- Automatic power down when deselected
- Complementary metal oxide semiconductor (CMOS) for optimum speed and power
- Available in Pb-free 36-ball very fine-pitch ball grid array (VFBGA), 32-pin thin small outline package (TSOP) II, and 32-pin small outline integrated circuit (SOIC) <sup>[1]</sup> packages

## Functional Description

The CY62148EV30 is a high performance CMOS static RAM organized as 512 K words by 8 bits. This device features advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption. Placing the device into standby mode reduces power consumption by more than 99 percent when deselected ( $\overline{CE}$  HIGH). The eight input and output pins ( $I/O_0$  through  $I/O_7$ ) are placed in a high impedance state when the device is deselected ( $\overline{CE}$  HIGH), the outputs are disabled ( $\overline{OE}$  HIGH), or during a write operation ( $\overline{CE}$  LOW and  $\overline{WE}$  LOW).

To write to the device, take Chip Enable ( $\overline{CE}$ ) and Write Enable ( $\overline{WE}$ ) inputs LOW. Data on the eight I/O pins ( $I/O_0$  through  $I/O_7$ ) is then written into the location specified on the address pins ( $A_0$  through  $A_{18}$ ).

To read from the device, take Chip Enable ( $\overline{CE}$ ) and Output Enable ( $\overline{OE}$ ) LOW while forcing Write Enable ( $\overline{WE}$ ) HIGH. Under these conditions, the contents of the memory location specified by the address pins appear on the I/O pins.

### Notes

- SOIC package is available only in 55 ns speed bin.
- NC pins are not connected on the die.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V<sub>CC</sub> = V<sub>CC(typ)</sub>, T<sub>A</sub> = 25 °C.

## Maximum Ratings

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage temperature ..... -65 °C to +150 °C

Ambient temperature with power applied ..... 55 °C to +125 °C

Supply voltage to ground potential ..... -0.3 V to  $V_{CC(max)}$  + 0.3 V

DC voltage applied to outputs in High Z State <sup>[5, 6]</sup> ..... -0.3 V to  $V_{CC(max)}$  + 0.3 V

DC input voltage <sup>[5, 6]</sup> ..... -0.3 V to  $V_{CC(max)}$  + 0.3 V

Output current into outputs (LOW) ..... 20 mA

Static discharge voltage (MIL-STD-883, Method 3015) ..... > 2001 V

Latch up current ..... > 200 mA

## Operating Range

| Product     | Range                     | Ambient Temperature | $V_{CC}$ <sup>[7]</sup> |
|-------------|---------------------------|---------------------|-------------------------|
| CY62148EV30 | Industrial / Automotive-A | -40 °C to +85 °C    | 2.2 V to 3.6 V          |

### Notes

5.  $V_{IL(min)}$  = -2.0 V for pulse durations less than 20 ns.

6.  $V_{IH(max)}$  =  $V_{CC} + 0.75$  V for pulse durations less than 20 ns.

7. Full device AC operation assumes a minimum of 100 μs ramp time from 0 to  $V_{CC(min)}$  and 200 μs wait time after  $V_{CC}$  stabilization.

8. SOIC package is available only in 55 ns speed bin.

9. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at  $V_{CC} = V_{CC(typ)}$ ,  $T_A = 25$  °C.

10. Under DC conditions the device meets a  $V_{IL}$  of 0.8V (for  $V_{CC}$  range of 2.7 V to 3.6 V) and 0.6 V (for  $V_{CC}$  range of 2.2 V to 2.7 V). However, in dynamic conditions Input LOW voltage applied to the device must not be higher than 0.6V and 0.4V for the above ranges. This is applicable to SOIC package only.

11. Chip Enable (CE) must be HIGH at CMOS level to meet the  $I_{SB1}$  /  $I_{SB2}$  /  $I_{CCDR}$  spec. Other inputs can be left floating.

## Capacitance

| Parameter <sup>[12]</sup> | Description        | Test Conditions                                                                  | Max | Unit |

## Data Retention Waveform

Figure 2. Data Retention Waveform

### Notes

13. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at  $V_{CC} = V_{CC(typ)}$ ,  $T_A = 25\text{ }^\circ\text{C}$ .
14. Chip Enable ( $\overline{CE}$ ) must be HIGH at CMOS level to meet the  $I_{SB1}$  /  $I_{SB2}$  /  $I_{CCDR}$  spec. Other inputs can be left floating.
15. Tested initially and after any design or process changes that may affect these parameters.
16. Full device AC operation requires linear  $V_{CC}$  ramp from  $V_{DR}$  to  $V_{CC(min)} \geq 100\text{ }\mu\text{s}$  or stable at  $V_{CC(min)} \geq 100\text{ }\mu\text{s}$ .

### Notes

17. In an earlier revision of this device, under a specific application condition, READ and WRITE operations were limited to switching of the chip enable signal as described in the Application Note [AN66311](#). However, the issue has been fixed and in production now, and hence, this Application Note is no longer applicable. It is available for download on our website as it contains information on the date code of the parts, beyond which the fix has been in production.
18. Test Conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns or less (1 V/ns), timing reference levels of  $V_{CC(typ)}/2$ , input pulse levels of 0 to  $V_{CC(typ)}$ , and output loading of the specified  $I_{OL}/I_{OH}$  as shown in the [Figure 1 on page 5](#).
19. SOIC package is available only in 55 ns speed bin.
20. At any given temperature and voltage condition,  $t_{HZCE}$  is less than  $t_{LZCE}$ ,  $t_{HZOE}$  is less than  $t_{LZOE}$ , and  $t_{HZWE}$  is less than  $t_{LZWE}$  for any given device.
21.  $t_{HZOE}$ ,  $t_{HZCE}$ , and  $t_{HZWE}$  transitions are measured when the output enter a high impedance state.
22. The internal write time of the memory is defined by the overlap of  $\overline{WE}$ ,  $\overline{CE} = V_{IL}$ . All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.
23. The minimum write cycle pulse width for Write Cycle No. 3 ( $\overline{WE}$  controlled,  $\overline{OE}$  LOW) should be equal to the sum of  $t_{SD}$  and  $t_{HZWE}$ .

## Switching Waveforms

**Figure 3. Read Cycle No. 1 (Address Transition Controlled)** [24, 25]

**Figure 4. Read Cycle No. 2 ( $\overline{\text{OE}}$  Controlled)** [25, 26]

**Figure 5. Write Cycle No. 1 ( $\overline{\text{WE}}$  Controlled,  $\overline{\text{OE}}$  HIGH During Write)** [27, 28]

### Notes

- 24. Device is continuously selected.  $\overline{\text{OE}}$ ,  $\overline{\text{CE}} = V_{\text{IL}}$ .
- 25. WE is HIGH for read cycles.
- 26. Address valid before or similar to  $\overline{\text{CE}}$  transition LOW.
- 27. Data I/O is high impedance if  $\overline{\text{OE}} = V_{\text{IH}}$ .
- 28. If CE goes HIGH simultaneously with WE HIGH, the output remains in high impedance state.
- 29. During this period, the I/Os are in output state. Do not apply input signals.

## Switching Waveforms (continued)

**Figure 6. Write Cycle No. 2 ( $\overline{\text{CE}}$  Controlled) [30, 31]**

**Figure 7. Write Cycle No. 3 ( $\overline{\text{WE}}$  Controlled,  $\overline{\text{OE}}$  LOW) [31, 33]**

### Notes

- 30. Data I/O is high impedance if  $\overline{\text{OE}} = V_{IL}$ .
- 31. If  $\overline{\text{CE}}$  goes HIGH simultaneously with  $\overline{\text{WE}}$  HIGH, the output remains in high impedance state.
- 32. During this period, the I/Os are in output state. Do not apply input signals.
- 33. The minimum write cycle pulse width should be equal to the sum of  $t_{SD}$  and  $t_{HZWE}$ .

## Truth Table

| $\overline{\text{CE}}$ <sup>[34]</sup> | $\overline{\text{WE}}$ | $\overline{\text{OE}}$ | Inputs/Outputs | Mode                | Power                       |
|----------------------------------------|------------------------|------------------------|----------------|---------------------|-----------------------------|
| H                                      | X                      | X                      | High Z         | Deselect/Power down | Standby ( $I_{\text{SB}}$ ) |
| L                                      | H                      | L                      | Data out       | Read                | Active ( $I_{\text{CC}}$ )  |
| L                                      | H                      | H                      | High Z         | Output disabled     | Active ( $I_{\text{CC}}$ )  |
| L                                      | L                      | X                      | Data in        | Write               | Active ( $I_{\text{CC}}$ )  |

### Note

<sup>34</sup>. Chip enable must be at CMOS levels (not floating). Intermediate voltage levels on this pin is not permitted.

## Ordering Information

© Cypress Semiconductor Corporation, 2004-2014. The information contained herein is subject to change without notice. Cypress Semiconductor Corporation assumes no responsibility for the use of any circuitry other than circuitry embodied in a Cypress product. Nor does it convey or imply any license under patent or other rights. Cypress products are not warranted nor intended to be used for medical, life support, life saving, critical control or safety applications, unless pursuant to an express written agreement with Cypress. Furthermore, Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress products in life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Any Source Code (software and/or firmware) is owned by Cypress Semiconductor Corporation (Cypress) and is protected by and subject to worldwide patent protection (United States and foreign), United States copyright laws and international treaty provisions. Cypress hereby grants to licensee a personal, non-exclusive, non-transferable license to copy, use, modify, create derivative works of, and compile the Cypress Source Code and derivative works for the sole purpose of creating custom software and or firmware in support of licensee product to be used only in conjunction with a Cypress integrated circuit as specified in the applicable agreement. Any reproduction, modification, translation, compilation, or representation of this Source Code except as specified above is prohibited without the express written permission of Cypress.

Disclaimer: CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Cypress reserves the right to make changes without further notice to the materials described herein. Cypress does not assume any liability arising out of the application or use of any product or circuit described herein. Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress' product in a life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Use may be limited by and subject to the applicable Cypress software license agreement.
