1 Introduction

The i.MX 6SoloLite processor represents Freescale's latest achievement in integrated multimedia applications processors, which are part of a growing family of multimedia-focused products that offer high performance processing and are optimized for lowest power consumption.

The processor features Freescale's advanced implementation of the a single ARM[®] Cortex[®]-A9 MPCore[™] multicore processor, which operates at speeds up to 1 GHz. It includes 2D graphics processor and integrated power management. The processor provides a 32-bit DDR3-800 memory interface and a number of other interfaces for connecting peripherals, such as WLAN, Bluetooth[™], GPS, hard drive, displays, and camera sensors.

The i.MX 6SoloLite processor is specifically useful for applications, such as:

- Color and monochrome eReaders
- Entry level tablets
- Barcode scanners

The i.MX 6SoloLite processor features:

- **Applications processor**—The processor enhances the capabilities of high-tier portable applications by fulfilling the ever increasing MIPS needs of operating systems and games. Freescale's Dynamic Voltage and Frequency Scaling (DVFS) provides significant power reduction, allowing the device to run at lower voltage and frequency with sufficient MIPS for tasks, such as audio decode.
- **Multilevel memory system**—The multilevel memory system of each processor is based on the L1 instruction and data caches, L2 cache, and internal and external memory. The processor supports many types of external memory devices, including DDR3, low voltage DDR3, LPDDR2, NOR Flash, PSRAM, cellular RAM, and managed NAND, including eMMC up to rev 4.4/4.41.
- **Smart speed technology**—The processor has power management throughout the IC that enables the rich suite of multimedia features and peripherals to consume minimum power in both active and various low power modes. Smart speed technology enables the designer to deliver a feature-rich product, requiring levels of power far lower than industry expectations.
- **Dynamic voltage and frequency scaling**—The processor improves the power efficiency of devices by scaling the voltage and frequency to optimize performance.
- **Multimedia powerhouse**—The multimedia performance of each processor is enhanced by a multilevel cache system, NEON™ MPE (Media Processor Engine) co-processor, and a programmable smart DMA (SDMA) controller.
- **Powerful graphics acceleration**—Each processor provides three independent, integrated graphics processing units: 2D BLit engine, a 2D graphics accelerator, and dedicated OpenVG™ 1.1 accelerator.
- **Interface flexibility**—The processor supports connections to a variety of interfaces: LCD controller, CMOS sensor interface (parallel), high-speed USB on-the-go with PHY, high-speed USB host PHY, multiple expansion card ports (high-speed MMC/SDIO host and other), 10/100 Mbps Ethernet controller, and a variety of other popular interfaces (such as UART, I²C, and I²S serial audio).
- **Electronic Paper Display Controller**—The processor integrates EPD controller that supports E-INK color and monochrome with up to 2048 x 1536 resolution at 106 Hz refresh, 4096 x 4096 resolution at 20 Hz refresh and 5-bit grayscale (32-levels per color channel).
- **Advanced security**—The processor delivers hardware-enabled security features that enable secure e-commerce, digital rights management (DRM), information encryption, secure boot, and secure software downloads. The security features are discussed in detail in the i.MX 6SoloLite security reference manual (IMX6SLSRM). Contact your local Freescale representative for more information.
- **Integrated power management**—The processor integrates linear regulators and generate internally all the voltage levels for different domains. This significantly simplifies system power management structure.
- **GPIO with interrupt capabilities**—The new GPIO pad design supports configurable dual voltage rails at 1.8V and 3.3V supplies. The pad is configurable to interface at either voltage level.

1.1 Ordering Information

[Table 1](#) shows the orderable part numbers covered by this data sheet. [Table 1](#) does not include all possible orderable part numbers. The latest part numbers are available on freescale.com/imx6series. If your desired part number is not listed in [Table 1](#), or you have questions about available parts, see freescale.com/imx6series or contact your Freescale representative.

Table 1. Example Orderable Part Numbers

Part Number	Mask Set	Options	Speed Grade	Temperature (Tj)	Package ¹
MCIMX6L8DVN10AB	N20G	GPU, EPDC	1GHz	0°C to +95°C	13x13mm, 0.5mm pitch BGA

MCIMX6L2EVN10AA	N20G	no GPU, no EPDC	1GHz	-40°C to +105°C	13x13mm, 0.5mm pitch BGA

¹ Case 2240 is RoHS compliant, lead-free MSL (moisture sensitivity level) 3.

[Figure 1](#) describes the part number nomenclature so that users can identify the characteristics of the specific part number they have (for example, Cores, Frequency, Temperature Grade, Fuse options, Silicon revision).

Ensure that you have the right data sheet for your specific part by checking the Temperature Grade (Junction) field and matching it to the right data sheet. If you have questions, see freescale.com/imx6series or contact your Freescale representative.

Figure 1. Part Number Nomenclature—i.MX 6SoloLite

1.2 Features

The i.MX 6SoloLite processor is based on ARM Cortex-A9 MPCore multicore processor, which has the following features:

- ARM Cortex-A9 MPCore CPU processor (with TrustZone)
- The core configuration is symmetric, where each core includes:
 - 32 KByte L1 Instruction Cache
 - 32 KByte L1 Data Cache
 - Private Timer and Watchdog
 - Cortex-A9 NEON MPE (Media Processing Engine) co-processor

The ARM Cortex-A9 MPCore complex includes:

- General Interrupt Controller (GIC) with 128 interrupt support
- Global Timer
- Snoop Control Unit (SCU)
- 256 KB unified I/D L2 cache
- Two Master AXI (64-bit) bus interfaces output of L2 cache
- Frequency of the core (including NEON and L1 cache) as per [Table 9, "Operating Ranges," on page 20](#)
- NEON MPE coprocessor
 - SIMD Media Processing Architecture

- NEON register file with 32x64-bit general-purpose registers
- NEON Integer execute pipeline (ALU, Shift, MAC)
- NEON dual, single-precision floating point execute pipeline (FADD, FMUL)
- NEON load/store and permute pipeline

The SoC-level memory system consists of the following additional components:

- Boot ROM, including HAB (96 KB)
- Internal multimedia / shared, fast access RAM (OCRAM, 128 KB)
- External memory interfaces:
 - 16-bit, and 32-bit DDR3-800, and LPDDR2-800 channels
 - 16/32-bit NOR Flash.
 - 16/32-bit PSRAM, Cellular RAM (32 bits or less)

Each i.MX 6SoloLite processor enables the following interfaces to external devices (some of them are muxed and not available simultaneously):

- Displays—Total three interfaces are available.
 - LCD, 24bit display port, up to 225 Mpixels/sec (for example, WUXGA at 60 Hz)
 - EPDC, color, and monochrome E-INK, up to 1650x2332 resolution and 5-bit grayscale
- Camera sensors:
 - Parallel Camera port (up to 16-bit and up to 66 MHz peak)
- Expansion cards:
 - Four MMC/SD/SDIO card ports all supporting:
 - 1-bit or 4-bit transfer mode specifications for SD and SDIO cards up to UHS-I SDR-104 mode (104 MB/s max)
 - 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards up to 52 MHz in both SDR and DDR modes (104 MB/s max)
- USB:
 - Two High Speed (HS) USB 2.0 OTG (Up to 480 Mbps), with integrated HS USB Phy
 - One USB 2.0 (480 Mbps) hosts:
 - One HS hosts with integrated HS-IC USB (High Speed Inter-Chip USB) Phy
- Miscellaneous IPs and interfaces:
 - SSI block—capable of supporting audio sample frequencies up to 192 kHz stereo inputs and outputs with I²S mode
 - Five UARTs, up to 5.0 Mbps each:
 - Providing RS232 interface
 - Supporting 9-bit RS485 multidrop mode
 - One of the five UARTs (UART1) supports 8-wire while others four supports 4-wire. This is due to the SoC IOMUX limitation, since all UART IPs are identical.
 - Four eCSPI (Enhanced CSPI)
 - Three I²C, supporting 400 kbps

- Ethernet Controller, 10/100 Mbps
- Four Pulse Width Modulators (PWM)
- System JTAG Controller (SJC)
- GPIO with interrupt capabilities
- 8x8 Key Pad Port (KPP)
- Sony Philips Digital Interface (SPDIF), Rx and Tx
- Two Watchdog timers (WDOG)
- Audio MUX (AUDMUX)

The i.MX 6SoloLite processor integrates advanced power management unit and controllers:

- Provide PMU, including LDO supplies, for on-chip resources
- Use Temperature Sensor for monitoring the die temperature
- Support DVFS techniques for low power modes
- Use Software State Retention and Power Gating for ARM and MPE
- Support various levels of system power modes
- Use flexible clock gating control scheme

The i.MX 6SoloLite processor uses dedicated HW accelerators to meet the targeted multimedia performance. The use of HW accelerators is a key factor in obtaining high performance at low power consumption numbers, while having the CPU core relatively free for performing other tasks.

The i.MX 6SoloLite processor incorporates the following hardware accelerators:

- GPU2Dv2—2D Graphics Processing Unit (BitBlt).
- GPUVG—OpenVG 1.1 Graphics Processing Unit.
- PXP—PiXeL Processing Pipeline. Off loading key pixel processing operations are required to support the EPD display applications.

Security functions are enabled and accelerated by the following hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, etc.)
- SJC—System JTAG Controller. Protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features.
- SNVS—Secure Non-Volatile Storage, including Secure Real Time Clock.
- CSU—Central Security Unit. Enhancement for the IC Identification Module (IIM). Will be configured during boot and by eFUSES and will determine the security level operation mode as well as the TZ policy.
- A-HAB—Advanced High Assurance Boot—HABv4 with the new embedded enhancements: SHA-256, 2048-bit RSA key, version control mechanism, warm boot, CSU, and TZ initialization.

NOTE

The actual feature set depends on the part numbers as described in [Table 1, "Example Orderable Part Numbers," on page 3](#). Functions, such as 2D hardware graphics acceleration or E-Ink may not be enabled for specific part numbers.

1.3 Updated Signal Naming Convention

The signal names of the i.MX6 series of products have been standardized to better align the signal names within the family and across the documentation. Some of the benefits of these changes are as follows:

- The names are unique within the scope of an SoC and within the series of products
- Searches will return all occurrences of the named signal
- The names are consistent between i.MX 6 series products implementing the same modules
- The module instance is incorporated into the signal name

This change applies only to signal names. The original ball names have been preserved to prevent the need to change schematics, BSDL models, IBIS models, etc.

Throughout this document, the updated signal names are used except where referenced as a ball name (such as the Functional Contact Assignments table, Ball Map table, and so on). A master list of the signal name changes is in the document, *IMX 6 Series Signal Name Mapping* (EB792). This list can be used to map the signal names used in older documentation to the new standardized naming conventions.

2 Architectural Overview

The following subsections provide an architectural overview of the i.MX 6SoloLite processor system.

2.1 Block Diagram

Figure 2 shows the functional modules in the i.MX 6SoloLite processor system.

Figure 2. i.MX 6SoloLite System Block Diagram

NOTE

The numbers in brackets indicate number of module instances. For example, PWM (4) indicates four separate PWM peripherals.

3 Modules List

The i.MX 6SoloLite processor contains a variety of digital and analog modules. [Table 2](#) describes these modules in alphabetical order.

Table 2. i.MX 6SoloLite Modules List

Block Mnemonic	Block Name	Subsystem	Brief Description
128x8 Fuse Box	Electrical Fuse Array	Security	Electrical Fuse Array. Enables to setup Boot Modes, Security Levels, Security Keys, and many other system parameters. The i.MX 6SoloLite processor consists of 2-128x8-bit fuse box accessible through OCOTP_CTRL interface.
ARM	ARM Platform	ARM	The ARM Cortex-A9 platform consists of a Cortex-A9 core version r2p10 and associated sub-blocks, including Level 2 Cache Controller, SCU (Snoop Control Unit), GIC (General Interrupt Controller), private timers, Watchdog, and CoreSight debug modules.
AUDMUX	Digital Audio Mux	Multimedia Peripherals	The AUDMUX is a programmable interconnect for voice, audio, and synchronous data routing between host serial interfaces (for example, SSI1, SSI2, and SSI3) and peripheral serial interfaces (audio and voice codecs). The AUDMUX has seven ports with identical functionality and programming models. A desired connectivity is achieved by configuring two or more AUDMUX ports.
CCM GPC SRC	Clock Control Module, General Power Controller, System Reset Controller	Clocks, Resets, and Power Control	These modules are responsible for clock and reset distribution in the system, and also for the system power management.
CSU	Central Security Unit	Security	The Central Security Unit (CSU) is responsible for setting comprehensive security policy within the i.MX 6SoloLite platform. The Security Control Registers (SCR) of the CSU are set during boot time by the HAB and are locked to prevent further writing.
CTI-1 CTI-2 CTI-3 CTI-4 CTI-5	Cross Trigger Interfaces	Debug / Trace	Cross Trigger Interfaces allows cross-triggering based on inputs from masters attached to CTIs. The CTI module is internal to the Cortex-A9 Core Platform.
CTM	Cross Trigger Matrix	Debug / Trace	Cross Trigger Matrix IP is used to route triggering events between CTIs. The CTM module is internal to the Cortex-A9 Core Platform.
DAP	Debug Access Port	System Control Peripherals	The DAP provides real-time access for the debugger without halting the core to: • System memory and peripheral registers • All debug configuration registers The DAP also provides debugger access to JTAG scan chains. The DAP module is internal to the Cortex-A9 Core Platform.
DCP	Data co-processor	Security	This module provides support for general encryption and hashing functions typically used for security functions. Because its basic job is moving data from memory to memory, it also incorporates a memory-copy (memcpy) function for both debugging and as a more efficient method of copying data between memory blocks than the DMA-based approach.

Table 2. i.MX 6SoloLite Modules List (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
eCSPI-1 eCSPI-2 eCSPI-3 eCSPI-4	Configurable SPI	Connectivity Peripherals	Full-duplex enhanced Synchronous Serial Interface. It is configurable to support Master/Slave modes, four chip selects to support multiple peripherals.
EIM	NOR-Flash /PSRAM interface	Connectivity Peripherals	The EIM NOR-FLASH / PSRAM provides: • Support 16-bit (in muxed IO mode only) PSRAM memories (sync and async operating modes), at slow frequency • Support 16-bit (in muxed IO mode only) NOR-Flash memories, at slow frequency • Multiple chip selects
EPDC	Electrophoretic Display Controller	Peripherals	The EPDC is a feature-rich, low power, and high-performance direct-drive, active matrix EPD controller. It is specifically designed to drive E-INK™ EPD panels, supporting a wide variety of TFT backplanes.
EPIT-1 EPIT-2	Enhanced Periodic Interrupt Timer	Timer Peripherals	Each EPIT is a 32-bit “set and forget” timer that starts counting after the EPIT is enabled by software. It is capable of providing precise interrupts at regular intervals with minimal processor intervention. It has a 12-bit prescaler for division of input clock frequency to get the required time setting for the interrupts to occur, and counter value can be programmed on the fly.
FEC	Fast Ethernet Controller	Connectivity Peripherals	The Ethernet Media Access Controller (MAC) is designed to support 10 and 100 Mbps Ethernet/IEEE 802.3 networks. An external transceiver interface and transceiver function are required to complete the interface to the media.
GPIO-1 GPIO-2 GPIO-3 GPIO-4 GPIO-5	General Purpose I/O Modules	System Control Peripherals	Used for general purpose input/output to external ICs. Each GPIO module supports 32 bits of I/O.
GPT	General Purpose Timer	Timer Peripherals	Each GPT is a 32-bit “free-running” or “set and forget” mode timer with programmable prescaler and compare and capture register. A timer counter value can be captured using an external event and can be configured to trigger a capture event on either the leading or trailing edges of an input pulse. When the timer is configured to operate in “set and forget” mode, it is capable of providing precise interrupts at regular intervals with minimal processor intervention. The counter has output compare logic to provide the status and interrupt at comparison. This timer can be configured to run either on an external clock or on an internal clock.
GPU2Dv2	Graphics Processing Unit-2D, ver 2	Multimedia Peripherals	The GPU2Dv2 provides hardware acceleration for 2D graphics algorithms, such as Bit BLT, stretch BLT, and many other 2D functions.
GPUVGv2	Vector Graphics Processing Unit, ver2	Multimedia Peripherals	OpenVG graphics accelerator provides OpenVG 1.1 support as well as other accelerations, including Real-time hardware curve tessellation of lines, quadratic and cubic Bezier curves, 16x Line Anti-aliasing, and various Vector Drawing functions.
I ² C-1 I ² C-2 I ² C-3	I ² C Interface	Connectivity Peripherals	I ² C provide serial interface for external devices. Data rates of up to 400 kbps are supported.

Table 2. i.MX 6SoloLite Modules List (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
IOMUXC	IOMUX Control	System Control Peripherals	This module enables flexible IO multiplexing. Each IO pad has default and several alternate functions. The alternate functions are software configurable.
KPP	Key Pad Port	Connectivity Peripherals	KPP Supports 8 x 8 external key pad matrix. KPP features are: • Open drain design • Glitch suppression circuit design • Multiple keys detection • Standby key press detection
LCDIF	LCD Interface	Multimedia Peripherals	The LCDIF provides display data for external LCD panels from simple text-only displays to WVGA, 16/18/24 bpp color TFT panels. The LCDIF supports all of these different interfaces by providing fully programmable functionality and sharing register space, FIFOs, and ALU resources at the same time. The LCDIF supports RGB (DOTCLK) modes as well as system mode including both VSYNC and WSYNC modes.
MMDC	Multi-Mode DDR Controller	Connectivity Peripherals	DDR Controller has the following features: • Support 16/32-bit DDR3-800 or LPDDR2-800 • Supports up to 2 GByte DDR memory space
OCOTP_CTRL	OTP Controller	Security	The On-Chip OTP controller (OCOTP_CTRL) provides an interface for reading, programming, and/or overriding identification and control information stored in on-chip fuse elements. The module supports electrically-programmable poly fuses (eFUSES). The OCOTP_CTRL also provides a set of volatile software-accessible signals that can be used for software control of hardware elements, not requiring non-volatility. The OCOTP_CTRL provides the primary user-visible mechanism for interfacing with on-chip fuse elements. Among the uses for the fuses are unique chip identifiers, mask revision numbers, cryptographic keys, JTAG secure mode, boot characteristics, and various control signals, requiring permanent non-volatility.
OCRAM	On-Chip Memory Controller	Data Path	The On-Chip Memory controller (OCRAM) module is designed as an interface between system's AXI bus and internal (on-chip) SRAM memory module. In i.MX 6SoloLite processor, the OCRM is used for controlling the 128 KB multimedia RAM through a 64-bit AXI bus.
OCRAM_L2	On-Chip Memory Controller for L2 Cache	Data Path	The On-Chip Memory controller for L2 cache (OCRAM_L2) module is designed as an interface between system's AXI bus and internal (on-chip) L2 cache memory module during boot mode.
OSC 32 kHz	OSC 32 kHz	Clocking	Generates 32.768 kHz clock from external crystal.
PMU	Power-Management functions	Data Path	Integrated power management unit. Used to provide power to various SoC domains.
PWM-1 PWM-2 PWM-3 PWM-4	Pulse Width Modulation	Connectivity Peripherals	The pulse-width modulator (PWM) has a 16-bit counter and is optimized to generate sound from stored sample audio images and it can also generate tones. It uses 16-bit resolution and a 4x16 data FIFO to generate sound.

Table 2. i.MX 6SoloLite Modules List (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
PXP	PiXel Processing Pipeline	Display Peripherals	A high-performance pixel processor capable of 1 pixel/clock performance for combined operations, such as color-space conversion, alpha blending, gamma-mapping, and rotation. The PXP is enhanced with features specifically for gray scale applications. In addition, the PXP supports traditional pixel/frame processing paths for still-image and video processing applications, allowing it to interface with either of the integrated EPD controllers.
RAM 128 KB	Internal RAM	Internal Memory	Internal RAM, which is accessed through OCRAM memory controller.
RNGB	Random Number Generator	Security	Random number generating module.
ROM 96KB	Boot ROM	Internal Memory	Supports secure and regular Boot Modes. Includes read protection on 4K region for content protection.
ROMCP	ROM Controller with Patch	Data Path	ROM Controller with ROM Patch support
SDMA	Smart Direct Memory Access	System Control Peripherals	The SDMA is multi-channel flexible DMA engine. It helps in maximizing system performance by off-loading the various cores in dynamic data routing. It has the following features: • Powered by a 16-bit Instruction-Set micro-RISC engine • Multi-channel DMA supporting up to 32 time-division multiplexed DMA channels • 48 events with total flexibility to trigger any combination of channels • Memory accesses including linear, FIFO, and 2D addressing • Shared peripherals between ARM and SDMA • Very fast Context-Software switching with 2-level priority based preemptive multi-tasking • DMA units with auto-flush and prefetch capability • Flexible address management for DMA transfers (increment, decrement, and no address changes on source and destination address) • DMA ports can handle unit-directional and bi-directional flows (copy mode) • Up to 8-word buffer for configurable burst transfers • Support of byte-swapping and CRC calculations • Library of Scripts and API is available
SJC	System JTAG Controller	System Control Peripherals	The SJC provides JTAG interface, which complies with JTAG TAP standards, to internal logic. The i.MX 6SoloLite processor uses JTAG port for production, testing, and system debugging. In addition, the SJC provides BSR (Boundary Scan Register) standard support, which complies with IEEE1149.1 and IEEE1149.6 standards. The JTAG port must be accessible during platform initial laboratory bring-up, for manufacturing tests and troubleshooting, as well as for software debugging by authorized entities. The i.MX 6SoloLite SJC incorporates three security modes for protecting against unauthorized accesses. Modes are selected through eFUSE configuration.
SNVS	Secure Non-Volatile Storage	Security	Secure Non-Volatile Storage, including Secure Real Time Clock, Security State Machine, Master Key Control, and Violation/Tamper Detection and reporting.
SPDIF	Sony Phillips Digital Interface	Multimedia Peripherals	A standard audio file transfer format, developed jointly by the Sony and Phillips corporations. Has Transmitter and Receiver functionality.

Table 2. i.MX 6SoloLite Modules List (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
SSI-1 SSI-2 SSI-3	I2S/SSI/AC97 Interface	Connectivity Peripherals	The SSI is a full-duplex synchronous interface, which is used on the AP to provide connectivity with off-chip audio peripherals. The SSI supports a wide variety of protocols (SSI normal, SSI network, I2S, and AC-97), bit depths (up to 24 bits per word), and clock / frame sync options. The SSI has two pairs of 8x24 FIFOs and hardware support for an external DMA controller in order to minimize its impact on system performance. The second pair of FIFOs provides hardware interleaving of a second audio stream that reduces CPU overhead in use cases where two time slots are being used simultaneously.
TEMPMON	Temperature Monitor	System Control Peripherals	The temperature monitor/sensor IP, for detecting high temperature conditions. The Temperature sensor IP for detecting die temperature. The temperature read out does not reflect case or ambient temperature, but the proximity of the temperature sensor location on the die. Temperature distribution may not be uniformly distributed, therefore the read out value may not be the reflection of the temperature value of the entire die.
TZASC	Trust-Zone Address Space Controller	Security	The TZASC (TZC-380 by ARM) provides security address region control functions required for intended application. It is used on the path to the DRAM controller.
UART-1 UART-2 UART-3 UART-4 UART-5	UART Interface	Connectivity Peripherals	Each of the UARTv2 modules support the following serial data transmit/receive protocols and configurations: • 7- or 8-bit data words, 1 or 2 stop bits, programmable parity (even, odd or none) • Programmable baud rates up to 5 MHz. • 32-byte FIFO on Tx and 32 half-word FIFO on Rx supporting auto-baud • IrDA 1.0 support (up to SIR speed of 115200 bps) • Option to operate as 8-pins full UART, DCE, or DTE
USBOH2A	2x USB 2.0 High Speed OTG and 1x HS Hosts	Connectivity Peripherals	USBO2H contains: • Two high-speed OTG module with integrated HS USB PHY • One identical high-speed Host modules connected to HSIC USB ports.

Table 2. i.MX 6SoloLite Modules List (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
uSDHC-1 uSDHC-2 uSDHC-2 uSDHC-4	SD/MMC and SDXC Enhanced Multi-Media Card / Secure Digital Host Controller	Connectivity Peripherals	i.MX 6SoloLite specific SoC characteristics: All four MMC/SD/SDIO controller IPs are identical and are based on the uSDHC IP. They are: - Fully compliant with MMC command/response sets and Physical Layer as defined in the Multimedia Card System Specification, v4.2/4.3/4.4/4.41 including high-capacity (size > 2 GB) cards HC MMC. HW reset as specified for eMMC cards is supported at ports #3 and #4 only. - Fully compliant with SD command/response sets and Physical Layer as defined in the SD Memory Card Specifications, v3.0 including high-capacity SDHC cards up to 32 GB and SDXC cards up to 2 TB. - Fully compliant with SDIO command/response sets and interrupt/read-wait mode as defined in the SDIO Card Specification, Part E1, v1.10 - Fully compliant with SD Card Specification, Part A2, SD Host Controller Standard Specification, v2.00 All four ports support: 1-bit or 4-bit transfer mode specifications for SD and SDIO cards up to UHS-I SDR104 mode (104 MB/s max) 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards up to 52 MHz in both SDR and DDR modes (104 MB/s max) However, the SoC level integration and I/O muxing logic restrict the functionality to the following: - Instances #1 and #2 are primarily intended to serve as external slots or interfaces to on-board SDIO devices. These ports are equipped with "Card detection" and "Write Protection" pads and do not support HW reset. - All ports can work with 1.8 V and 3.3 V cards. There are two completely independent I/O power domains for Ports #1 and #2 in four bit configuration (SD interface). Port #3 is placed in his own independent power domain and port #4 shares power domain with some other interfaces.
WDOG-1	Watchdog	Timer Peripherals	The Watchdog Timer supports two comparison points during each counting period. Each of the comparison points is configurable to evoke an interrupt to the ARM core, and a second point evokes an external event on the WDOG line.
WDOG-2 (TZ)	Watchdog (TrustZone)	Timer Peripherals	The TrustZone Watchdog (TZ WDOG) timer module protects against TrustZone starvation by providing a method of escaping normal mode and forcing a switch to the TZ mode. TZ starvation is a situation where the normal OS prevents switching to the TZ mode. Such situation is undesirable as it can compromise the system's security. Once the TZ WDOG module is activated, it must be serviced by TZ software on a periodic basis. If servicing does not take place, the timer times out. Upon a time-out, the TZ WDOG asserts a TZ mapped interrupt that forces switching to the TZ mode. If it is still not served, the TZ WDOG asserts a security violation signal to the CSU. The TZ WDOG module cannot be programmed or deactivated by a normal mode Software.
XTALOSC	Crystal Oscillator I/F	Clocking	The XTALOSC module enables connectivity to external crystal oscillator device. In a typical application use-case, it is used for 24 MHz oscillator.

3.1 Special Signal Considerations

Table 3 lists special signal considerations for the i.MX 6SoloLite processor. The signal names are listed in alphabetical order.

The package contact assignments can be found in [Section 6, “Package Information and Contact Assignments.”](#) Signal descriptions are provided in the i.MX 6SoloLite reference manual.

Table 3. Special Signal Considerations

Signal Name	Remarks
XTALOSC_CLK1_P/ XTALOSC_CLK1_N	One general purpose differential high speed clock Input/output is provided. It could be used to: - To feed external reference clock to the PLLs and further to the modules inside SoC, for example as alternate reference clock for Audio interfaces, etc. - To output internal SoC clock to be used outside the SoC as either reference clock or as a functional clock for peripherals. See the i.MX 6SoloLite reference manual for details on the respective clock trees. The clock inputs/outputs are LVDS differential pairs compatible with TIA/EIA-644 standard, the maximum clock out frequency range supported is 528 MHz. Alternatively one may use single ended signal to drive XTALOSC_CLK1_P input. In this case, the corresponding XTALOSC_CLK1_N input should be tied to the constant voltage level equal 1/2 of the input signal swing. Termination should be provided in case of high frequency signals. See LVDS pad electrical specification for further details. After initialization, the XTALOSC_CLK1 input/output could be disabled (if not used). If unused, the XTALOSC_CLK1_N/P pair may be left floating.
DRAM_VREF	When using DRAM_VREF with DDR I/O, the nominal reference voltage must be half of the NVCC_DRAM supply. The user must tie DRAM_VREF to a precision external resistor divider. Use a 1 kΩ 0.5% resistor to GND and a 1 kΩ 0.5% resistor to NVCC_DRAM. Shunt each resistor with a closely-mounted 0.1 μF capacitor. To reduce supply current, a pair of 1.5 kΩ 0.1% resistors can be used. Using resistors with recommended tolerances ensures the $\pm 2\%$ DRAM_VREF tolerance (per the DDR3 specification) is maintained when four DDR3 ICs plus the i.MX 6SoloLite are drawing current on the resistor divider. It is recommended to use regulated power supply for “big” memory configurations (more that eight devices).
JTAG_nnnn	The JTAG interface is summarized in Table 4. Use of external resistors is unnecessary. However, if external resistors are used, the user must ensure that the on-chip pull-up/down configuration is followed. For example, do not use an external pull down on an input that has on-chip pull-up. JTAG_TDO is configured with a keeper circuit such that the floating condition is eliminated if an external pull resistor is not present. An external pull resistor on JTAG_TDO is detrimental and should be avoided. JTAG_MODE must be externally connected to GND for normal operation. Termination to GND through an external pull-down resistor (such as 1 kΩ) is allowed. JTAG_MODE set to high configures the JTAG interface to mode compliant with IEEE1149.1 standard. JTAG_MODE set to low configures the JTAG interface for common Software debug adding all the system TAPs to the chain.
NC	These signals are No Connect (NC) and should be floated by the user.
SRC_ONOFF	In normal mode may be connected to ONOFF button (de-bouncing provided at this input). Internally this pad is pulled up. A short duration (<5s) connection to GND in OFF mode causes the internal power management state machine to change the state to ON. In ON mode, a short duration connection to GND generates interrupt (intended to initiate a software controllable power down). A long duration (above ~5s) connection to GND causes “forced” OFF.

Table 3. Special Signal Considerations (continued)

Signal Name	Remarks
SRC_POR_B	This cold reset negative logic input resets all modules and logic in the IC. May be used in addition to internally generated power on reset signal (logical AND, both internal and external signals are considered active low)
RTC_XTALI/ RTC_XTALO	If the user wishes to configure RTC_XTALI and RTC_XTALO as an RTC oscillator, a 32.768 kHz crystal (≤ 100 k Ω ESR, 10 pF load) should be connected between RTC_XTALI and RTC_XTALO. Keep in mind the capacitors implemented on either side of the crystal are about twice the crystal load capacitor. To hit the exact oscillation frequency, the board capacitors need to be reduced to account for board and chip parasitics. The integrated oscillation amplifier is self biasing, but relatively weak. Care must be taken to limit parasitic leakage from RTC_XTALI and RTC_XTALO to either power or ground (>100 M Ω). This will debias the amplifier and cause a reduction of startup margin. Typically RTC_XTALI and RTC_XTALO should bias to approximately 0.5 V. If it is desired to feed an external low frequency clock into RTC_XTALI, the RTC_XTALO pin should be left floating or driven with a complimentary signal. The logic level of this forcing clock should not exceed VDD_SNVS_CAP level and the frequency should be <100 kHz under typical conditions. In the case when a high accuracy real time clock is not required, the system may use an internal low frequency ring oscillator. It is recommended to connect RTC_XTALI to GND and keep RTC_XTALO floating.
TEST_MODE	TEST_MODE is for Freescale factory use. This signal is internally connected to an on-chip pull-down device. The user must either float this signal or tie it to GND.
XTALI/XTALO	A 24.0 MHz crystal should be connected between XTALI and XTALO. level and the frequency should be <32 MHz under typical conditions. The crystal must be rated for a maximum drive level of 250 μ W. An ESR (equivalent series resistance) of typically 80 Ω is recommended. Freescale BSP (board support package) software requires 24 MHz on XTALI/XTALO. The crystal can be eliminated if an external 24 MHz oscillator is available in the system. In this case, XTALI must be directly driven by the external oscillator and XTALO is floated. The XTALI signal level must swing from $\sim 0.8 \times \text{NVCC_PLL_OUT}$ to ~ 0.2 V. This clock is used as a reference for USB, so there are strict frequency tolerance and jitter requirements. See the XTALOSC chapter and relevant interface specifications chapters of the i.MX 6SoloLite reference manual, for details.
ZQPAD	DRAM calibration resistor 240 Ω 1% used as reference during DRAM output buffer driver calibration should be connected between this pad and GND.

Table 4. JTAG Controller Interface Summary

JTAG	I/O Type	On-Chip Termination
JTAG_TCK	Input	47 k Ω pull-up
JTAG_TMS	Input	47 k Ω pull-up
JTAG_TDI	Input	47 k Ω pull-up
JTAG_TDO	3-state output	Keeper
JTAG_TRST_B	Input	47 k Ω pull-up
JTAG_MODE	Input	100 k Ω pull-up

3.2 Recommended Connections for Unused Analog Interfaces

Table 5 shows the recommended connections for unused analog interfaces.

Table 5. Recommended Connections for Unused Analog Interfaces

Module	Pad Name	Recommendations if Unused?
XTALOSC	XTALOSC_CLK1_N, XTALOSC_CLK1_P	Float
USB	USB_OTGx_DN, USB_OTGx_DP, USB_OTGx_VBUS, USB_OTG_CHD_B	Float

4 Electrical Characteristics

This section provides the device and module-level electrical characteristics for the i.MX 6SoloLite.

4.1 Chip-Level Conditions

This section provides the device-level electrical characteristics for the IC. See Table 6 for a quick reference to the individual tables and sections.

Table 6. i.MX 6SoloLite Chip-Level Conditions

For these characteristics, ...	Topic appears ...
Absolute Maximum Ratings	on page 18
BGA Case 2240 Package Thermal Resistance	on page 18
Operating Ranges	on page 20
External Clock Sources	on page 22
Maximum Supply Currents	on page 23
Low Power Mode Supply Currents	on page 24
USB PHY Current Consumption	on page 25

4.1.1 Absolute Maximum Ratings

CAUTION

Stresses beyond those listed under Table 7 may affect reliability or cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated in the Operating Ranges or Parameters tables is not implied.

Table 7. Absolute Maximum Ratings

Parameter Description	Symbol	Min	Max ¹	Unit
Core supply voltages	VDD_ARM_IN VDD_SOC_IN VDD_PU_IN	-0.3	1.5	V
Internal supply voltages	VDD_ARM_CAP VDD_SOC_CAP VDD_PU_CAP	-0.3	1.3	V
GPIO supply voltage	Supplies denoted as I/O supply	-0.5	3.6	V
DDR I/O supply voltage	Supplies denoted as I/O supply	-0.4	1.975	V
VDD_HIGH_IN supply voltage	VDD_HIGH_IN	-0.3	3.6	V
USB_OTG1_VBUS, USB_OTG2_VBUS	USB_OTG1_VBUS USB_OTG2_VBUS	—	5.25	V
Input voltage on USB_OTG1_DP, USB_OTG1_DN, and USB_OTG2_DP, USB_OTG2_DN pins	USB_OTG1_DP/USB_OTG1_DN USB_OTG2_DP/USB_OTG2_DN	-0.3	3.63	V
Input/output voltage range	V_{in}/V_{out}	-0.5	$OVDD^2+0.3$	V
ESD Immunity (HBM)	Vesd_CDM	—	2000	V
ESD Immunity (CDM)	Vesd_CDM	—	500	V
Storage temperature range	T _{STORAGE}	-40	150	°C

¹ Exceeding maximum may result in breakdown, or reduction in IC life time, performance, and/or reliability.

² OVDD is the I/O supply voltage.

4.1.2 Thermal Resistance

4.1.2.1 BGA Case 2240 Package Thermal Resistance

Table 8 provides the MAPBGA package thermal resistance data.

Table 8. Package Thermal Resistance Data

Rating	Board	Symbol	No Lid	Unit
Junction to Ambient ¹ (natural convection)	Single layer board (1s)	R _{θJA}	51	°C/W
	Four layer board (2s2p)	R _{θJA}	28	°C/W
Junction to Ambient ¹ (at 200 ft/min)	Single layer board (1s)	R _{θJMA}	40	°C/W
	Four layer board (2s2p)	R _{θJMA}	24	°C/W
Junction to Board ²	—	R _{θJB}	14	°C/W
Junction to Case ³ (Top)	—	R _{θJCTop}	9	°C/W
Junction to Package Top ⁴	Natural Convection	Ψ _{JT}	2	°C/W

¹ Junction-to-Ambient Thermal Resistance was determined per JEDEC JESD51-3 and JESD51-6. Thermal test board meets JEDEC specification for this package.

- ² Junction-to-Board Thermal Resistance was determined per JEDEC JESD51-8. Thermal test board meets JEDEC specification for the specified package.
- ³ Junction-to-Case at the top of the package was determined by using MIL-STD 883 Method 1012.1. The cold plate temperature is used for the case temperature. Reported value includes the thermal resistance of the interface layer.
- ⁴ Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

4.1.3 Operating Ranges

Figure 3 shows major power systems blocks and internal/external connections for the i.MX 6SoloLite processor.

Figure 3. i.MX 6SoloLite SoC Power Block Diagram

Table 9 provides the operating ranges of the i.MX 6SoloLite processor.

Table 9. Operating Ranges

Parameter Description	Symbol	Min	Typ	Max ¹	Unit	Comment
Run mode: LDO enabled	VDD_ARM_IN	1.375 ²	—	1.5	V	LDO output set at 1.250V minimum for operation up to 996MHz.
		1.275 ²	—	1.5	V	LDO output set at 1.150V minimum for operation up to 792MHz
		1.075 ²	—	1.5	V	LDO output set at 0.95V minimum for operation up to 396MHz
		1.075 ²	—	1.5	V	LDO output set at 0.950V minimum for operation up to 192MHz
		1.050 ²	—	1.5	V	LDO output set at 0.9250V minimum for operation up to 24MHz
	VDD_SOC_IN ³ VDD_PU_IN	1.275 ^{2,4}	—	1.5	V	VDD_SOC and VDD_PU LDO outputs (VDD_SOC_CAP and VDD_PU_CAP) require 1.15 V minimum.
Run mode: LDO bypassed	VDD_ARM_IN	1.250	—	1.3	V	LDO bypassed for operation up to 996 MHz.
		1.150	—	1.3	V	LDO bypassed for operation up to 792 MHz.
		0.950	—	1.3	V	LDO bypassed for operation up to 396 MHz.
		0.950	—	1.3	V	LDO bypassed for operation up to 192MHz
		0.925	—	1.3	V	LDO bypassed for operation up to 24MHz
	VDD_SOC_IN ³ VDD_PU_IN	1.15 ⁴	—	1.3	V	—
Standby/DSM Mode	VDD_ARM_IN	0.9	—	1.3	V	See Table 12, "Stop Mode Current and Power Consumption," on page 24.
	VDD_SOC_IN VDD_PU_IN	0.9	—	1.3	V	
VDDHIGH internal Regulator	VDD_HIGH_IN ⁵	2.8	—	3.3	V	Must match the range of voltages that the rechargeable backup battery supports.
Backup battery supply range	VDD_SNVS_IN ⁵	2.8	—	3.3	V	Should be supplied from the same supply as VDD_HIGH_IN if the system does not require keeping real time and other data on OFF state.
USB supply voltages	USB_OTG1_VBUS USB_OTG2_VBUS	4.4	—	5.25	V	—
DDR I/O supply	NVCC_DRAM	1.14	1.2	1.3	V	LPDDR2
		1.425	1.5	1.575	V	DDR3
	NVCC_DRAM_2P5	2.5	2.5	2.75	V	—

Table 9. Operating Ranges (continued)

Parameter Description	Symbol	Min	Typ	Max ¹	Unit	Comment
GPIO supplies ⁶	NVCC33_IO	2.8	3.0	3.3	V	Worst case, assuming all SOC I/O operating at 1.8V. NVCC33_IO must always be greater than NVCC18_IO.
	NVCC18_IO	1.62	1.8	1.98	V	—
	NVCC_1P2V	1.14	1.2	1.3	V	For LPDDR2
		1.283	1.35	1.45	V	For DDR3L
		1.425	1.5	1.575	V	For DDR3
Junction temperature	T _J	0	—	95	°C	Commercial See <i>i.MX 6SoloLite Product Lifetime Usage Estimates Application Note</i> , AN4726, for information on product lifetime (power-on years) for this processor.
Junction temperature	T _J	-40	—	105	—	Extended commercial See <i>i.MX 6SoloLite Product Lifetime Usage Estimates Application Note</i> , AN4726, for information on product lifetime (power-on years) for this processor.

¹ Applying the maximum voltage results in maximum power consumption and heat generation. Freescale recommends a voltage set point = (Vmin + the supply tolerance). This results in an optimized power/speed ratio.

² VDD_ARM_IN and VDD_SOC_IN must be at least 125 mV higher than the LDO Output Set Point for correct voltage regulation.

³ VDD_SOC_CAP and VDD_PU_CAP must be equal.

⁴ VDD_SOC and VDD_PU output voltage must be set to this rule: $VDD_ARM - VDD_SOC / VDD_PU < 50mV$.

⁵ While setting VDD_SNVS_IN voltage with respect to Charging Currents and RTC, refer to Hardware Development Guide for i.MX 6Dual, 6Quad, 6Solo, 6DualLite Families of Applications Processors (IMX6DQ6SDLHDG).

⁶ All digital I/O supplies (NVCC_xxxx) must be powered under normal conditions whether the associated I/O pins are in use or not, and associated I/O pins need to have a pull-up or pull-down resistor applied to limit any floating gate current.

4.1.4 External Clock Sources

Each i.MX 6SoloLite processor has two external input system clocks: a low frequency (RTC_XTALI) and a high frequency (XTALI).

The RTC_XTALI is used for low-frequency functions. It supplies the clock for wake-up circuit, power-down real time clock operation, and slow system and watchdog counters. The clock input can be connected to either an external oscillator or a crystal using the internal oscillator amplifier. Additionally, there is an internal ring oscillator, which can substitute the RTC_XTALI, in case accuracy is not important.

The system clock input XTALI is used to generate the main system clock. It supplies the PLLs and other peripherals. The system clock input can be connected to either an external oscillator or a crystal using the internal oscillator amplifier.

NOTE

The internal RTC oscillator does not provide an accurate frequency and is affected by process, voltage, and temperature variations. Freescale strongly recommends using an external crystal as the RTC_XTALI reference. If the internal oscillator is used instead, careful consideration must be given to the timing implications on all of the SoC modules dependent on this clock.

Table 10 shows the interface frequency requirements.

Table 10. External Input Clock Frequency

Parameter Description	Symbol	Min	Typ	Max	Unit
RTC_XTALI Oscillator ^{1, 2}	f_{ckil}	—	32.768 ^(see 3) /32.0	—	kHz
XTALI Oscillator ^{4, 2}	f_{xtal}	—	24	—	MHz

¹ External oscillator or a crystal with internal oscillator amplifier.

² The required frequency stability of this clock source is application dependent. For recommendations, see Hardware Development Guide for i.MX 6Dual, 6Quad, 6Solo, 6DualLite Families of Applications Processors (IMX6DQ6SDLHDG).

³ Recommended nominal frequency 32.768 kHz.

⁴ External oscillator or a fundamental frequency crystal with internal oscillator amplifier.

The typical values shown in Table 10 are required for use with Freescale BSPs to ensure precise time keeping and USB operation. For RTC_XTALI operation, two clock sources are available:

- On-chip 40 kHz ring oscillator: This clock source has the following characteristics:
 - Approximately 25 μ A more I_{dd} than crystal oscillator
 - Approximately $\pm 50\%$ tolerance
 - No external component required
 - Starts up quicker than 32 kHz crystal oscillator
- External crystal oscillator with on-chip support circuit
 - At power up, ring oscillator is utilized. After crystal oscillator is stable, the clock circuit switches over to the crystal oscillator automatically.
 - Higher accuracy than ring oscillator
 - If no external crystal is present, then the ring oscillator is utilized

The decision to choose a clock source should be taken based on real-time clock use and precision time-out.

4.1.5 Maximum Supply Currents

The Power Virus numbers shown in Table 11 represent a use case designed specifically to show the maximum current consumption possible. All cores are running at the defined maximum frequency and are limited to L1 cache accesses only to ensure no pipeline stalls. Although a valid condition, it would have a very limited practical use case, if at all, and be limited to an extremely low duty cycle unless the intention was to specifically show the worst case power consumption.

The Freescale power management IC, MMPF0100xxxx, which is targeted for the i.MX 6 series processor family, supports the power consumption shown in Table 11, however a robust thermal design is required for the increased system power dissipation.

See the i.MX 6SoloLite Power Consumption Measurement Application Note (AN4715) for more details on typical power consumption under various use case definitions.

Table 11. Maximum Supply Currents

Power Line	Conditions	Max Current	Unit
VDD_ARM_IN	1 GHz ARM clock based on Power Virus operation	1100	mA
VDD_SOC_IN	1 GHz ARM clock	650	mA
VDD_PU_IN	1 GHz ARM clock	150	mA
VDD_HIGH_IN	—	30 ¹	mA
VDD_SNVS_IN	—	250 ²	μA
USB_OTG1_VBUS USB_OTG2_VBUS	—	25 ³	mA
Primary Interface (IO) Supplies			
NVCC_DRAM	—	(see ⁴)	
NVCC33_IO	N=156	Use maximum IO Equation ⁵	
NVCC18_IO	N=156	Use maximum IO Equation ⁵	
NVCC_1P2V	N=2	Use maximum IO Equation ⁵	mA
MISC			
DRAM_VREF	—	1	mA

¹ The actual maximum current drawn from VDD_HIGH_IN will be as shown plus any additional current drawn from the VDD_HIGH_CAP outputs, depending upon actual application configuration (for example, NVCC_DRAM_2P5 supplies).

² The maximum VDD_SNVS_IN current may be higher depending on specific operating configurations, such as BOOT_MODE[1:0] not equal to 00, or use of the Tamper feature. During initial power on, VDD_SNVS_IN can draw up to 1 mA, if available. VDD_SNVS_CAP charge time will increase if less than 1 mA is available.

³ This is the maximum current per active USB physical interface.

⁴ The DRAM power consumption is dependent on several factors, such as external signal termination. DRAM power calculators are typically available from the memory vendors. They take in account factors, such as signal termination. See the i.MX 6SoloLite Power Consumption Measurement Application Note or examples of DRAM power consumption during specific use case scenarios.

⁵ General equation for estimated, maximum power consumption of an IO power supply:

$$I_{max} = N \times C \times V \times (0.5 \times F)$$

Where:

N—Number of IO pins supplied by the power line

C—Equivalent external capacitive load

V—IO voltage

(0.5 xF)—Data change rate. Up to 0.5 of the clock rate (F)

In this equation, I_{max} is in Amps, C in Farads, V in Volts, and F in Hertz.

4.1.6 Low Power Mode Supply Currents

Table 12 shows the current core consumption (not including I/O) of i.MX 6SoloLite processor in selected low power modes.

Table 12. Stop Mode Current and Power Consumption

Mode	Test Conditions	Supply	Typical ¹	Unit
WAIT	- ARM, SoC, and PU LDOs are set to 1.225 V - HIGH LDO set to 2.5 V - Clocks are gated - DDR is in self refresh - PLLs are active in bypass (24 MHz) - Supply voltages remain ON	VDD_ARM_IN (1.375 V)	4	mA
		VDD_SOC_IN (1.375 V)	7.5	
		VDD_PU_IN (1.375 V)	1.5	
		VDD_HIGH_IN (3.0 V)	9	
		Total	44.9	mW
STOP_ON	- ARM LDO set to 0.9 V - SoC and PU LDOs set to 1.225 V - HIGH LDO set to 2.5 V - PLLs disabled - DDR is in self refresh	VDD_ARM_IN (1.375 V)	2.5	mA
		VDD_SOC_IN (1.375 V)	7.5	
		VDD_PU_IN (1.375 V)	1.5	
		VDD_HIGH_IN (3.0 V)	4.5	
		Total	29.3	mW
STOP_OFF	- ARM LDO set to 0.9 V - SoC LDO set to 1.225 V - PU LDO is power gated - HIGH LDO set to 2.5 V - PLLs disabled - DDR is in self refresh	VDD_ARM_IN (1.375 V)	2.5	mA
		VDD_SOC_IN (1.375 V)	7.5	
		VDD_PU_IN (1.375 V)	0.1	
		VDD_HIGH_IN (3.0 V)	4.0	
		Total	25.9	mW
STANDBY	- ARM and PU LDOs are power gated - SoC LDO is in bypass - HIGH LDO is set to 2.5 V - PLLs are disabled - Low voltage - Well Bias ON - XTAL is enabled	VDD_ARM_IN (0.9 V)	0.1	mA
		VDD_SoC_IN (0.9 V)	1.0	
		VDD_PU_IN (0.9 V)	0.1	
		VDD_HIGH_IN (3.0 V)	3	
		Total	10.1	mW
Deep Sleep Mode (DSM)	- ARM and PU LDOs are power gated - SoC LDO is in bypass - HIGH LDO is set to 2.5 V - PLLs are disabled - Low voltage - Well Bias ON - XTAL and bandgap are disabled	VDD_ARM_IN (0.9 V)	0.1	mA
		VDD_SoC_IN (0.9 V)	0.75	
		VDD_PU_IN (0.9 V)	0.1	
		VDD_HIGH_IN (3.0 V)	0.15	
		Total	1.3	mW
SNVS Only	- VDD_SNVS_IN powered - All other supplies off - SRTC running	VDD_SNVS_IN (2.8V)	41	μA
		Total	115	μW

¹ The typical values shown here are for information only and are not guaranteed. These values are average values measured on a worst-case wafer at 25°C.

4.1.7 USB PHY Current Consumption

4.1.7.1 Power Down Mode

In power down mode, everything is powered down, including the USB_OTGx_VBUS valid detectors, typical condition. Table 13 shows the USB interface current consumption in power down mode.

Table 13. USB PHY Current Consumption in Power Down Mode

	VDD_USB_CAP (3.0 V)	VDDHIGH_CAP (2.5 V)	NVCC_PLL_OUT (1.1 V)
Current	5.1 μ A	1.7 μ A	<0.5 μ A

NOTE

The currents on the VDD_HIGH_CAP and VDD_USB_CAP were identified to be the voltage divider circuits in the USB-specific level shifters.

4.2 Power Supplies Requirements and Restrictions

The system design must comply with power-up sequence, power-down sequence, and steady state guidelines as described in this section to guarantee the reliable operation of the device. Any deviation from these sequences may result in the following situations:

- Excessive current during power-up phase
- Prevention of the device from booting
- Irreversible damage to the processor (worst-case scenario)

4.2.1 Power-Up Sequence

For power-up sequence, the restrictions are as follows:

- VDD_SNVS_IN supply must be turned ON before any other power supply. It may be connected (shorted) with VDD_HIGH_IN supply.
- If a coin cell is used to power VDD_SNVS_IN, then ensure that it is connected before any other supply is switched on.
- If the external SRC_POR_B signal is used to control the processor POR, then SRC_POR_B must be immediately asserted at power-up and remain asserted until the VDD_ARM_CAP, VDD_SOC_CAP, and VDD_PU_CAP supplies are stable. VDD_ARM_IN and VDD_SOC_IN may be applied in either order with no restrictions. In the absence of an external reset feeding the SRC_POR_B input, the internal POR module takes control. See the i.MX 6SoloLite reference manual (IMX6SLRM) for further details and to ensure that all necessary requirements are being met.
- If the external SRC_POR_B signal is not used (always held high or left unconnected), the processor defaults to the internal POR function (where the PMU controls generation of the POR based on the power supplies). If the internal POR function is used, the following power supply requirements must be met:
 - VDD_ARM_IN and VDD_SOC_IN may be supplied from the same source, or

- VDD_SOC_IN can be supplied before VDD_ARM_IN with a maximum delay of 1 ms.

NOTE

Ensure that there is no back voltage (leakage) from any supply on the board towards the 3.3 V supply (for example, from the external components that use both the 1.8 V and 3.3 V supplies).

NOTE

USB_OTG_VBUS and USB_H1_VBUS are not part of the power supply sequence and can be powered at any time.

4.2.2 Power-Down Sequence

Table 14 shows the power down sequence orders. The two cases shown are, using the i.MX6 SoloLite internal supplies (non-bypass) and bypassing the internal LDO supplies.

Table 14. Power-Down Sequencing Order

Power Rail Name	Using all internal LDOs (non-bypass mode)	Internal LDOs Bypassed
VDD_SNVS_IN	7	9
VDD_HIGH_IN / NVCC33_IO	6	8
VDD_HIGH_CAP	6	7
NVCC18_IO	5	6
NVCC_PLL	6	5
NVCC_DRAM	4	4
VDD_ARM_IN	3	3
VDD_PU_IN	2	2
VDD_SOC_IN	1	1
USB_VBUS	N/A	N/A

NOTE

- VDD_ARM_IN, VDD_PU_IN, and VDD_SOC_IN can startup at the same. However, VDD_ARM_IN and VDD_PU_IN must be at their target values within 0.5 ms of VDD_SOC_IN.
- There are no special timing requirements for USB_OTGx_VBUS.

4.2.3 Power Supplies Usage

All I/O pins should not be externally driven while the I/O power supply for the pin (NVCC_XXX) is OFF. This can cause internal latch-up and malfunctions due to reverse current flows. For information about I/O

power supply of each pin, see “Power Group” column of [Table 73, "13 x 13 mm Functional Contact Assignments,"](#) on page 88.

4.3 Integrated LDO Voltage Regulator Parameters

Various internal supplies can be powered ON from internal LDO voltage regulators. All the supply pins named *_CAP must be connected to external capacitors. The onboard LDOs are intended for internal use only and should not be used to power any external circuitry. See the i.MX 6SoloLite reference manual for details on the power tree scheme recommended operation.

NOTE

The *_CAP signals should not be powered externally. These signals are intended for internal LDO or LDO bypass operation only.

4.3.1 Digital Regulators (LDO_ARM, LDO_PU, LDO_SOC)

There are three digital LDO regulators (“Digital”, because of the logic loads that they drive, not because of their construction). The advantages of the regulators are to reduce the input supply variation because of their input supply ripple rejection and their on die trimming. This translates into more voltage for the die producing higher operating frequencies. These regulators have three basic modes.

- Bypass. The regulation FET is switched fully on passing the external voltage, DCDC_LOW, to the load unaltered. The analog part of the regulator is powered down in this state, removing any loss other than the IR drop through the power grid and FET.
- Power Gate. The regulation FET is switched fully off limiting the current draw from the supply. The analog part of the regulator is powered down here limiting the power consumption.
- Analog regulation mode. The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25 mV steps.

For additional information, see the i.MX 6SoloLite reference manual.

4.3.2 Regulators for Analog Modules

4.3.2.1 LDO_1P1

The LDO_1P1 regulator implements a programmable linear-regulator function from VDD_HIGH_IN (see [Table 9](#) for min and max input requirements). Typical Programming Operating Range is 1.0 V to 1.2 V with the nominal default setting as 1.1 V. LDO_1P1 supplies the USB Phy and the PLLs. A programmable brown-out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded to take the necessary steps. Current-limiting can be enabled to allow for in-rush current requirements during start-up, if needed. Active-pull-down can also be enabled for systems requiring this feature.

For information on external capacitor requirements for this regulator, see the Hardware Development Guide for i.MX 6SoloLite Applications Processors (IMX6SLHDG). For additional information, see the i.MX 6SoloLite reference manual.

4.3.2.2 LDO_2P5

The LDO_2P5 module implements a programmable linear-regulator function from VDD_HIGH_IN (see Table 9 for min and max input requirements). Typical Programming Operating Range is 2.25 V to 2.75 V with the nominal default setting as 2.5 V. LDO_2P5 supplies the USB Phy, LVDS Phy and PLLs. A programmable brown-out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded, to take the necessary steps. Current-limiting can be enabled to allow for in-rush current requirements during start-up, if needed. Active-pull-down can also be enabled for systems requiring this feature. An alternate self-biased low-precision weak-regulator is included that can be enabled for applications needing to keep the output voltage alive during low-power modes where the main regulator driver and its associated global bandgap reference module are disabled. The output of the weak-regulator is not programmable and is a function of the input supply as well as the load current. Typically, with a 3 V input supply the weak-regulator output is 2.525 V and its output impedance is approximately 40 Ω .

For information on external capacitor requirements for this regulator, see the Hardware Development Guide for i.MX 6SoloLite Applications Processors (IMX6SLHDG).

For additional information, see the i.MX 6SoloLite reference manual.

4.3.2.3 LDO_USB

The LDO_USB module implements a programmable linear-regulator function from the USB_OTG1_VBUS and USB_OTG2_VBUS voltages (4.4 V–5.25 V) to produce a nominal 3.0 V output voltage. A programmable brown-out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded, to take the necessary steps. This regulator has a built in power-mux that allows the user to select to run the regulator from either VBUS supply, when both are present. If only one of the VBUS voltages is present, then, the regulator automatically selects this supply. Current limit is also included to help the system meet in-rush current targets. If no VBUS voltage is present, then the VBUSVALID threshold setting will prevent the regulator from being enabled.

For information on external capacitor requirements for this regulator, see the Hardware Development Guide for i.MX 6SoloLite Applications Processors (IMX6SLHDG).

For additional information, see the i.MX 6SoloLite reference manual.

4.4 PLL's Electrical Characteristics

4.5 On-Chip Oscillators

4.5.1 OSC24M

This block implements an amplifier that when combined with a suitable quartz crystal and external load capacitors implements an oscillator. It also implements a power mux such that the oscillator can be powered from NVCC_1P2V or VDD_SOC. NVCC_1P2V should be the cleaner supply and is the preferable choice, however, if the oscillator is required to run in *stop mode* then it is necessary to run from VDD_SOC, which is 0.9 V in stop mode.

The system crystal oscillator consists of a Pierce-type structure running off the digital supply. A straight forward biased-inverter implementation is used.

4.5.2 OSC32K

This block implements an amplifier that when combined with a suitable quartz crystal and external load capacitors implements a low power oscillator. It also implements a power mux such that it can be powered from either a ~3 V backup battery (VDD_SNVS_IN) or VDD_HIGH_IN such as the oscillator consumes power from VDD_HIGH_IN when that supply is available and transitions to the back up battery when VDD_HIGH_IN is lost.

In addition, if the clock monitor determines that the OSC32K is not present, then the source of the 32 kHz clock will automatically switch to the internal ring oscillator.

CAUTION

The internal RTC oscillator does not provide an accurate frequency and is affected by process, voltage and temperature variations. Freescale strongly recommends using an external crystal as the RTC_XTALI reference. If the internal oscillator is used instead, careful consideration must be given to the timing implications on all of the SoC modules dependent on this clock.

The OSC32k runs from VDD_SNVS_CAP, which comes from the VDD_HIGH_IN/VDD_SNVS_IN power mux. The target battery is a ~3 V coin cell. Proper choice of coin cell type is necessary for chosen VDD_HIGH_IN range. Appropriate series resistor (Rs) must be used when connecting the coin cell. Rs depends on the charge current limit that depends on the chosen coin cell. For example, for Panasonic ML621:

- Average Discharge Voltage is 2.5 V
- Maximum Charge Current is 0.6 mA

For a charge voltage of 3.2 V, $R_s = (3.2 - 2.5) / 0.6 \text{ m} = 1.17 \text{ k}$

NOTE

Always refer to the chosen coin cell manufacturer's data sheet for the latest information.

Table 20. OSC32K Main Characteristics

Parameter	Min	Typ	Max	Comments
Fosc	—	32.768 kHz	—	This frequency is nominal and determined mainly by the crystal selected. 32.0 K would work as well.
Current consumption	—	4 μ A	—	The typical value shown is only for the oscillator, driven by an external crystal. If the internal ring oscillator is used instead of an external crystal, then approximately 25 μ A should be added to this value.
Bias resistor	—	14 M Ω	—	This the integrated bias resistor that sets the amplifier into a high gain state. Any leakage through the ESD network, external board leakage, or even a scope probe that is significant relative to this value will debias the amp. The debiasing will result in low gain, and will impact the circuit's ability to start up and maintain oscillations.
Target Crystal Properties				
Cload	—	10 pF	—	Usually crystals can be purchased tuned for different Cloads. This Cload value is typically 1/2 of the capacitances realized on the PCB on either side of the quartz. A higher Cload will decrease oscillation margin, but increases current oscillating through the crystal.
ESR	—	50 k Ω	—	Equivalent series resistance of the crystal. Choosing a crystal with a higher value will decrease the oscillating margin.

4.6 I/O DC Parameters

This section includes the DC parameters of the following I/O types:

- Dual Voltage General Purpose I/O cell set (DVGPIIO)
- Single Voltage General Purpose I/O cell set (GPIO)
- Double Data Rate I/O (DDR) for LPDDR2 and DDR3 modes

NOTE

The term OVDD in this section refers to the associated supply rail of an input or output.

**Figure 4. Circuit for Parameters Voh and Vol for I/O Cells**

4.6.1 XTALI and RTC_XTALI (Clock Inputs) DC Parameters

Table 21 shows the DC parameters for the clock inputs.

Table 21. XTALI and RTC_XTALI DC Parameters

Parameter	Symbol	Test Conditions	Min	Max	Unit
XTALI high-level DC input voltage	V _{ih}	—	0.8 x NVCC_PLL_OUT	NVCC_PLL_OUT	V
XTALI low-level DC input voltage	V _{il}	—	0	0.2V	V
RTC_XTALI high-level DC input voltage	V _{ih}	—	0.8	1.1	V
RTC_XTALI low-level DC input voltage	V _{il}	—	0	0.2V	V

4.6.2 Dual Voltage General Purpose IO cell set (DVGPI0) DC Parameters

Table 22 shows DC parameters for GPIO pads. The parameters in Table 23 are guaranteed per the operating ranges in Table 9, unless otherwise noted.

Table 22. DVGPI0 I/O DC Parameters

Parameter	Symbol	Test Conditions	Min	Max	Unit
High-level output voltage ¹	V _{oh}	I _{oh} = -0.1 mA (DSE ² = 001, 010) I _{oh} = -1 mA (DSE = 011, 100, 101, 110, 111)	OVDD - 0.15	—	V
Low-level output voltage ¹	V _{ol}	I _{ol} = 0.1 mA (DSE ² = 001, 010) I _{ol} = 1mA (DSE = 011, 100, 101, 110, 111)	—	0.15	V
High-Level DC input voltage ^{1, 3}	V _{ih}	—	0.7 × OVDD	OVDD	V
Low-Level DC input voltage ^{1, 3}	V _{il}	—	0	0.3 × OVDD	V
Input Hysteresis	V _{hys}	OVDD = 1.8 V OVDD = 3.3 V	0.25	—	V
Schmitt trigger VT ₊ ^{3, 4}	VT ₊	—	0.5 × OVDD	—	V
Schmitt trigger VT ₋ ^{3, 4}	VT ₋	—	—	0.5 × OVDD	V
Input current (no pull-up/down)	I _{in}	V _{in} = OVDD or 0	-1.25	1.25	μA
Input current (22 kΩ pull-up)	I _{in}	V _{in} = 0 V V _{in} = OVDD	—	212 1	μA
Input current (47 kΩ pull-up)	I _{in}	V _{in} = 0 V V _{in} = OVDD	—	100 1	μA
Input current (100 kΩ pull-up)	I _{in}	V _{in} = 0 V V _{in} = OVDD	—	48 1	μA
Input current (100 kΩ pull-down)	I _{in}	V _{in} = 0 V V _{in} = OVDD	—	1 48	μA
Keeper circuit resistance	R _{keep}	V _{in} = 0.3 x OVDD V _{in} = 0.7 x OVDD	105	205	kΩ

- ¹ Overshoot and undershoot conditions (transitions above OVDD and below GND) on switching pads must be held below 0.6 V, and the duration of the overshoot/undershoot must not exceed 10% of the system clock cycle. Overshoot/undershoot must be controlled through printed circuit board layout, transmission line impedance matching, signal line termination, or other methods. Non-compliance to this specification may affect device reliability or cause permanent damage to the device.
- ² DSE is the Drive Strength Field setting in the associated IOMUX control register.
- ³ To maintain a valid level, the transition edge of the input must sustain a constant slew rate (monotonic) from the current DC level through to the target DC level, Vil or Vih. Monotonic input transition time is from 0.1 ns to 1 s.
- ⁴ Hysteresis of 250 mV is guaranteed over all operating conditions when hysteresis is enabled.

4.6.3 Single Voltage General Purpose I/O (GPIO) DC Parameters

Table 23 shows DC parameters for GPIO pads. The parameters in Table 23 are guaranteed per the operating ranges in Table 9, unless otherwise noted.

Table 23. GPIO I/O DC Parameters

Parameter	Symbol	Test Conditions	Min	Max	Unit
High-level output voltage ¹	Voh	Ioh = -0.1 mA (DSE ² = 001, 010) Ioh = -1 mA (DSE = 011, 100, 101, 110, 111)	OVDD - 0.15	—	V
Low-level output voltage ¹	Vol	Iol = 0.1 mA (DSE ² = 001, 010) Iol = 1mA (DSE = 011, 100, 101, 110, 111)	—	0.15	V
High-Level DC input voltage ^{1, 3}	Vih	—	0.7 × OVDD	OVDD	V
Low-Level DC input voltage ^{1, 3}	Vil	—	0	0.3 × OVDD	V
Input Hysteresis	Vhys	OVDD = 3.3 V	0.25	—	V
Schmitt trigger VT+ ^{3, 4}	VT+	—	0.5 × OVDD	—	V
Schmitt trigger VT- ^{3, 4}	VT-	—	—	0.5 × OVDD	V
Input current (no pull-up/down)	Iin	Vin = OVDD or 0	-1.25	1.25	μA
Input current (22 kΩ pull-up)	Iin	Vin = 0 V Vin = OVDD	—	212 1	μA
Input current (47 kΩ pull-up)	Iin	Vin = 0 V Vin = OVDD	—	100 1	μA
Input current (100 kΩ pull-up)	Iin	Vin = 0 V Vin = OVDD	—	48 1	μA
Input current (100 kΩ pull-down)	Iin	Vin = 0 V Vin = OVDD	—	1 48	μA
Keeper circuit resistance	Rkeep	Vin = 0.3 × OVDD Vin = 0.7 × OVDD	105	205	kΩ

- ¹ Overshoot and undershoot conditions (transitions above OVDD and below GND) on switching pads must be held below 0.6 V, and the duration of the overshoot/undershoot must not exceed 10% of the system clock cycle. Overshoot/undershoot must be controlled through printed circuit board layout, transmission line impedance matching, signal line termination, or other methods. Non-compliance to this specification may affect device reliability or cause permanent damage to the device.
- ² DSE is the Drive Strength Field setting in the associated IOMUX control register.
- ³ To maintain a valid level, the transition edge of the input must sustain a constant slew rate (monotonic) from the current DC level through to the target DC level, Vil or Vih. Monotonic input transition time is from 0.1 ns to 1 s.
- ⁴ Hysteresis of 250 mV is guaranteed over all operating conditions when hysteresis is enabled.

4.6.4 DDR I/O DC Parameters

The DDR I/O pads support LPDDR2 and DDR3 operational modes.

4.6.4.1 LPDDR2 Mode I/O DC Parameters

The LPDDR2 interface mode fully complies with JESD209-2B LPDDR2 JEDEC standard release June, 2009. The parameters in [Table 24](#) are guaranteed per the operating ranges in [Table 9](#), unless otherwise noted.

Table 24. LPDDR2 I/O DC Electrical Parameters¹

Parameters	Symbol	Test Conditions	Min	Max	Unit
High-level output voltage	V _{oh}	I _{oh} = -0.1 mA	0.9 × OVDD	—	V
Low-level output voltage	V _{ol}	I _{ol} = 0.1 mA	—	0.1 × OVDD	V
Input reference voltage	V _{ref}	—	0.49 × OVDD	0.51 × OVDD	
DC input High Voltage	V _{ih} (dc)	—	V _{ref} +0.13V	OVDD	V
DC input Low Voltage	V _{il} (dc)	—	OVSS	V _{ref} -0.13V	V
Differential Input Logic High	V _{ih} (diff)	—	0.26	See Note ²	
Differential Input Logic Low	V _{il} (diff)	—	See Note ²	-0.26	
Input current (no pull-up/down)	I _{in}	V _{in} = 0 or OVDD	-2.5	2.5	μA
Pull-up/pull-down impedance Mismatch	MM _{pupd}	—	-15	+15	%
240 Ω unit calibration resolution	R _{res}	—	—	10	Ω
Keeper circuit resistance	R _{keep}	—	110	175	kΩ

¹ Note that the JEDEC LPDDR2 specification (JESD209_2B) supersedes any specification in this document.

² The single-ended signals need to be within the respective limits (V_{ih}(dc) max, V_{il}(dc) min) for single-ended signals as well as the limitations for overshoot and undershoot (see [Table 28](#)).

4.6.4.2 DDR3 Mode I/O DC Parameters

The DDR3 interface mode fully complies with JESD79-3D DDR3 JEDEC standard release April, 2008. The parameters in [Table 25](#) are guaranteed per the operating ranges in [Table 9](#), unless otherwise noted.

4.7 I/O AC Parameters

Table 25. DDR3 I/O DC Electrical Parameters

Parameters	Symbol	Test Conditions	Min	Max	Unit
High-level output voltage	V _{oh}	I _{oh} = -0.1 mA V _{oh} (DSE = 001)	0.8 × OVDD ¹	—	V
		I _{oh} = -1 mA V _{oh} (for all except DSE = 001)			

Table 25. DDR3 I/O DC Electrical Parameters (continued)

Parameters	Symbol	Test Conditions	Min	Max	Unit
Low-level output voltage	Vol	I _{ol} = 0.1 mA Vol (DSE = 001)	—	0.2 × OVDD	V
		I _{ol} = 1 mA Vol (for all except DSE = 001)			
Input reference voltage	V _{ref} ²	—	0.49 × OVDD	0.51 × OVDD	
DC input Logic High	V _{ih} (dc)	—	V _{ref} +0.1	OVDD	V
DC input Logic Low	V _{il} (dc)	—	OVSS	V _{ref} -0.1	V
Differential input Logic High	V _{ih} (diff)	—	0.2	See Note ³	V
Differential input Logic Low	V _{il} (diff)	—	See Note ³	-0.2	V
Termination Voltage	V _{tt}	V _{tt} tracking OVDD/2	0.49 × OVDD	0.51 × OVDD	V
Input current (no pull-up/down)	I _{in}	V _{in} = 0 or OVDD	-2.9	2.9	μA
Pull-up/pull-down impedance mismatch	MM _{pupd}	—	-10	10	%
240 Ω unit calibration resolution	R _{res}	—	—	10	Ω
Keeper circuit resistance ⁴	R _{keep}	—	105	175	kΩ

¹ OVDD – I/O power supply (1.425 V–1.575 V for DDR3)

² V_{ref} – DDR3 external reference voltage

³ The single-ended signals need to be within the respective limits (V_{ih}(dc) max, V_{il}(dc) min) for single-ended signals as well as the limitations for overshoot and undershoot (see [Table 29](#)).

⁴ Use an off-chip pull resistor of 10 kΩ or less to override this keeper.

This section includes the AC parameters of the following I/O types:

- General Purpose I/O (GPIO)
- Dual Voltage General Purpose I/O (DVGPIIO)
- Double Data Rate I/O (DDR) for LPDDR2 and DDR3 modes

The GPIO and DDR I/O load circuit and output transition time waveforms are shown in [Figure 5](#) and [Figure 6](#).

Figure 5. Load Circuit for Output

Figure 6. Output Transition Time Waveform

4.7.1 General Purpose I/O AC Parameters

The I/O AC parameters for GPIO in slow and fast modes are presented in the [Table 26](#) and [Table 27](#), respectively. Note that the fast or slow I/O behavior is determined by the appropriate control bits in the IOMUXC control registers.

Table 26. General Purpose I/O AC Parameters 1.8 V Mode

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Output Pad Transition Times, rise/fall (Max Drive, ipp_dse=111)	tr, tf	15 pF Cload, slow slew rate 15 pF Cload, fast slew rate	—	—	2.72/2.79 1.51/1.54	ns
Output Pad Transition Times, rise/fall (High Drive, ipp_dse=101)	tr, tf	15 pF Cload, slow slew rate 15 pF Cload, fast slew rate	—	—	3.20/3.36 1.96/2.07	
Output Pad Transition Times, rise/fall (Medium Drive, ipp_dse=100)	tr, tf	15 pF Cload, slow slew rate 15 pF Cload, fast slew rate	—	—	3.64/3.88 2.27/2.53	
Output Pad Transition Times, rise/fall (Low Drive, ipp_dse=011)	tr, tf	15 pF Cload, slow slew rate 15 pF Cload, fast slew rate	—	—	4.32/4.50 3.16/3.17	
Input Transition Times ¹	trm	—	—	—	25	ns

¹ Hysteresis mode is recommended for inputs with transition times greater than 25 ns.

Table 27. General Purpose I/O AC Parameters 3.3 V Mode

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Output Pad Transition Times, rise/fall (Max Drive, ipp_dse=101)	tr, tf	15 pF Cload, slow slew rate 15 pF Cload, fast slew rate	—	—	1.70/1.79 1.06/1.15	ns
Output Pad Transition Times, rise/fall (High Drive, ipp_dse=011)	tr, tf	15 pF Cload, slow slew rate 15 pF Cload, fast slew rate	—	—	2.35/2.43 1.74/1.77	
Output Pad Transition Times, rise/fall (Medium Drive, ipp_dse=010)	tr, tf	15 pF Cload, slow slew rate 15 pF Cload, fast slew rate	—	—	3.13/3.29 2.46/2.60	
Output Pad Transition Times, rise/fall (Low Drive, ipp_dse=001)	tr, tf	15 pF Cload, slow slew rate 15 pF Cload, fast slew rate	—	—	5.14/5.57 4.77/5.15	
Input Transition Times ¹	trm	—	—	—	25	ns

¹ Hysteresis mode is recommended for inputs with transition times greater than 25 ns.

4.7.2 DDR I/O AC Parameters

The LPDDR2 interface mode fully complies with JESD209-2B LPDDR2 JEDEC standard release June, 2009. The DDR3 interface mode fully complies with JESD79-3D DDR3 JEDEC standard release April, 2008.

Table 28 shows the AC parameters for DDR I/O operating in LPDDR2 mode.

Table 28. DDR I/O LPDDR2 Mode AC Parameters¹

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
AC input logic high	Vih(ac)	—	Vref + 0.22	—	OVDD	V
AC input logic low	Vil(ac)	—	0	—	Vref – 0.22	V
AC differential input high voltage ²	Vidh(ac)	—	0.44	—	—	V
AC differential input low voltage	Vidl(ac)	—	—	—	0.44	V
Input AC differential cross point voltage ³	Vix(ac)	Relative to Vref	-0.12	—	0.12	V
Over/undershoot peak	Vpeak	—	—	—	0.35	V
Over/undershoot area (above OVDD or below OVSS)	Varea	400 MHz	—	—	0.3	V-ns
Single output slew rate, measured between Vol (ac) and Voh (ac)	tsr	50 Ω to Vref. 5 pF load. Drive impedance = 40 $\Omega \pm 30\%$	1.5	—	3.5	V/ns
		50 Ω to Vref. 5pF load. Drive impedance = 60 $\Omega \pm 30\%$	1	—	2.5	
Skew between pad rise/fall asymmetry + skew caused by SSN	t _{SKD}	clk = 400 MHz	—	—	0.1	ns

¹ Note that the JEDEC LPDDR2 specification (JESD209_2B) supersedes any specification in this document.

² Vid(ac) specifies the input differential voltage $V_{tr} - V_{cp}$ required for switching, where V_{tr} is the “true” input signal and V_{cp} is the “complementary” input signal. The Minimum value is equal to $V_{ih}(ac) - V_{il}(ac)$.

³ The typical value of Vix(ac) is expected to be about $0.5 \times OVDD$. and Vix(ac) is expected to track variation of OVDD. Vix(ac) indicates the voltage at which differential input signal must cross.

Table 29 shows the AC parameters for DDR I/O operating in DDR3 mode.

Table 29. DDR I/O DDR3 Mode AC Parameters¹

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
AC input logic high	Vih(ac)	—	Vref + 0.175	—	OVDD	V
AC input logic low	Vil(ac)	—	0	—	Vref – 0.175	V
AC differential input voltage ²	Vid(ac)	—	0.35	—	—	V
Input AC differential cross point voltage ³	Vix(ac)	Relative to Vref	Vref – 0.15	—	Vref + 0.15	V
Over/undershoot peak	Vpeak	—	—	—	0.4	V
Over/undershoot area (above OVDD or below OVSS)	Varea	400 MHz	—	—	0.5	V-ns

Table 29. DDR I/O DDR3 Mode AC Parameters¹ (continued)

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Single output slew rate, measured between Vol (ac) and Voh (ac)	tsr	Driver impedance = 34 Ω	2.5	—	5	V/ns
Skew between pad rise/fall asymmetry + skew caused by SSN	t _{SKD}	clk = 400 MHz	—	—	0.1	ns

¹ Note that the JEDEC JESD79_3C specification supersedes any specification in this document.

² Vid(ac) specifies the input differential voltage |Vtr-Vcpl| required for switching, where Vtr is the “true” input signal and Vcp is the “complementary” input signal. The Minimum value is equal to Vih(ac) – Vil(ac).

³ The typical value of Vix(ac) is expected to be about 0.5 × OVDD, and Vix(ac) is expected to track variation of OVDD. Vix(ac) indicates the voltage at which differential input signal must cross.

4.8 Output Buffer Impedance Parameters

This section defines the I/O impedance parameters of the i.MX 6SoloLite processor for the following I/O types:

- Dual Voltage General Purpose I/O cell set (DVGPIIO)
- Single Voltage General Purpose I/O cell set (GPIO)
- Double Data Rate I/O (DDR) for LPDDR2, and DDR3 modes

NOTE

GPIO and DDR I/O output driver impedance is measured with “long” transmission line of impedance Ztl attached to I/O pad and incident wave launched into transmission line. Rpu/Rpd and Ztl form a voltage divider that defines specific voltage of incident wave relative to OVDD. Output driver impedance is calculated from this voltage divider (see [Figure 7](#)).

Figure 7. Impedance Matching Load for Measurement

4.8.1 Dual Voltage GPIO Output Buffer Impedance

Table 30 shows the GPIO output buffer impedance (OVDD 1.8 V).

Table 30. DVGPIIO Output Buffer Average Impedance (OVDD 1.8 V)

Parameter	Symbol	Drive Strength (ipp_dse)	Typ Value	Unit
Output Driver Impedance	Rdrv	001	260	Ω
		010	130	
		011	90	
		100	60	
		101	50	
		110	40	
		111	33	

Table 31 shows the GPIO output buffer impedance (OVDD 3.3 V).

Table 31. DVGPIO Output Buffer Average Impedance (OVDD 3.3 V)

Parameter	Symbol	Drive Strength (ipp_dse)	Typ Value	Unit
Output Driver Impedance	Rdrv	001	150	Ω
		010	75	
		011	50	
		100	37	
		101	30	
		110	25	
		111	20	

4.8.2 Single Voltage GPIO Output Buffer Impedance

Table 32 shows the GPIO output buffer impedance (OVDD 3.3 V).

Table 32. GPIO Output Buffer Average Impedance (OVDD 3.3 V)

Parameter	Symbol	Drive Strength (ipp_dse)	Typ Value	Unit
Output Driver Impedance	Rdrv	001	150	Ω
		010	75	
		011	50	
		100	37	
		101	30	
		110	25	
		111	20	

4.8.3 DDR I/O Output Buffer Impedance

The LPDDR2 interface fully complies with JESD209-2B LPDDR2 JEDEC standard release June, 2009. The DDR3 interface fully complies with JESD79-3D DDR3 JEDEC standard release April, 2008.

Table 33 shows DDR I/O output buffer impedance of i.MX 6SoloLite processor.

Table 33. DDR I/O Output Buffer Impedance

Parameter	Symbol	Test Conditions	Typical		Unit
			NVCC_DRAM=1.5 V (DDR3) DDR_SEL=11	NVCC_DRAM=1.2 V (LPDDR2) DDR_SEL=10	
Output Driver Impedance	Rdrv	Drive Strength (DSE) =			Ω
		000	Hi-Z	Hi-Z	
		001	240	240	
		010	120	120	
		011	80	80	
		100	60	60	
		101	48	48	
		110	40	40	
		111	34	34	

Note:

1. Output driver impedance is controlled across PVTs using ZQ calibration procedure.
2. Calibration is done against 240 Ω external reference resistor.
3. Output driver impedance deviation (calibration accuracy) is $\pm 5\%$ (max/min impedance) across PVTs.

4.9 System Modules Timing

This section contains the timing and electrical parameters for the modules in each i.MX 6SoloLite processor.

4.9.1 Reset Timings Parameters

Figure 8 shows the reset timing and Table 34 lists the timing parameters.

Figure 8. Reset Timing Diagram

Table 34. Reset Timing Parameters

ID	Parameter	Min	Max	Unit
CC1	Duration of POR_B to be qualified as valid.	1	—	XTALOSC_RTC_XTALI

4.9.2 WDOG Reset Timing Parameters

Figure 9 shows the WDOG reset timing and Table 35 lists the timing parameters.

Figure 9. WDOG_B Timing Diagram

Table 35. WDOG_B Timing Parameters

ID	Parameter	Min	Max	Unit
CC3	Duration of WDOG_B Assertion	1	—	RTC_XTALI cycle

NOTE

RTC_XTALI is approximately 32 kHz. RTC_XTALI cycle is one period or approximately 30 μ s.

NOTE

WDOG_B output signals (for each one of the Watchdog modules) do not have dedicated bins, but are muxed out through the IOMUX. See the IOMUX manual for detailed information.

4.9.3 External Interface Module (EIM)

The following subsections provide information on the EIM. The maximum operating frequency for EIM data transfer is 104 MHz. Timing parameters in this section that are given as a function of register settings or clock periods are valid for the entire range of allowed frequencies (0–104 MHz).

4.9.3.1 EIM Interface Pads Allocation

EIM supports 32-bit, 16-bit, and 8-bit devices operating in address/data separate or multiplexed modes. [Table 36](#) provides EIM interface pads allocation in different modes.

Table 36. EIM Internal Module Multiplexing¹

Setup	Non Multiplexed Address/Data Mode			Multiplexed Address/Data mode	
	8 Bit		16 Bit	16 Bit	32 Bit
	MUM = 0, DSZ = 100	MUM = 0, DSZ = 101	MUM = 0, DSZ = 001	MUM = 1, DSZ = 001	MUM = 1, DSZ = 011
EIM_ADDR [15:00]	EIM_AD [15:00]	EIM_AD [15:00]	EIM_AD [15:00]	EIM_AD [15:00]	EIM_AD [15:00]
EIM_ADDR [25:16]	EIM_ADDR [25:16]	EIM_ADDR [25:16]	EIM_ADDR [25:16]	EIM_ADDR [25:16]	EIM_DATA [09:00]
EIM_DATA [07:00], EIM_EB0_B	EIM_DATA [07:00]	—	EIM_DATA [07:00]	EIM_AD [07:00]	EIM_AD [07:00]
EIM_DATA [15:08], EIM_EB1_B	—	EIM_DATA [15:08]	EIM_DATA [15:08]	EIM_AD [15:08]	EIM_AD [15:08]
EIM_DATA [23:16], EIM_EB2_B	—	—	—	—	EIM_DATA [07:00]
EIM_DATA [31:24], EIM_EB3_B	—	—	—	—	EIM_DATA [15:08]

¹ For more information on configuration ports mentioned in this table, see the i.MX 6SoloLite reference manual.

4.9.3.2 General EIM Timing-Synchronous Mode

Figure 10, Figure 11, and Table 37 specify the timings related to the EIM module. All EIM output control signals may be asserted and deasserted by an internal clock synchronized to the BCLK rising edge according to corresponding assertion/negation control fields.

Figure 10. EIM Output Timing Diagram

Figure 11. EIM Input Timing Diagram

4.9.3.3 Examples of EIM Synchronous Accesses

Table 37. EIM Bus Timing Parameters

ID	Parameter	Min ¹	Max ¹	Unit
WE1	EIM_BCLK cycle time ²	$t \times (k+1)$	—	ns
WE2	EIM_BCLK high level width	$0.4 \times t \times (k+1)$	—	ns
WE3	EIM_BCLK low level width	$0.4 \times t \times (k+1)$	—	ns
WE4	Clock rise to address valid	—	$-0.5 \times t \times (k+1)/2 + 2.25$	ns

Table 37. EIM Bus Timing Parameters (continued)

ID	Parameter	Min ¹	Max ¹	Unit
WE5	Clock rise to address invalid	$0.5 \times t \times (k+1)/2 - 1.25$	—	ns
WE6	Clock rise to EIM_CSx_B valid	—	$-0.5 \times t \times (k+1)/2 + 2.25$	ns
WE7	Clock rise to EIM_CSx_B invalid	$0.5 \times t \times (k+1)/2 - 1.25$	—	ns
WE8	Clock rise to EIM_RW_B valid	—	$-0.5 \times t \times (k+1)/2 + 2.25$	ns
WE9	Clock rise to EIM_RW_B invalid	$0.5 \times t \times (k+1)/2 - 1.25$	—	ns
WE10	Clock rise to EIM_OE_B valid	—	$-0.5 \times t \times (k+1)/2 + 2.25$	ns
WE11	Clock rise to EIM_OE_B invalid	$0.5 \times t \times (k+1)/2 - 1.25$	—	ns
WE12	Clock rise to EIM_EBx_B valid	—	$-0.5 \times t \times (k+1)/2 + 2.25$	ns
WE13	Clock rise to EIM_EBx_B invalid	$0.5 \times t \times (k+1)/2 - 1.25$	—	ns
WE14	Clock rise to EIM_LBA_B valid	—	$-0.5 \times t \times (k+1)/2 + 2.25$	ns
WE15	Clock rise to EIM_LBA_B invalid	$0.5 \times t \times (k+1)/2 - 1.25$	—	ns
WE16	Clock rise to output data valid	—	$-(k+1) \times t/2 + 2.75$	ns
WE17	Clock rise to output data invalid	$(k+1) \times t/2 - 1.25$	—	ns
WE18	Input data setup time to clock rise	2.3	—	ns
WE19	Input data hold time from clock rise	2	—	ns
WE20	EIM_WAIT_B setup time to clock rise	2	—	ns
WE21	EIM_WAIT_B hold time from clock rise	2	—	ns

¹ k represents register setting BCD value

² t is clock period (1/Freq). For 104 MHz, t = 9.165 ns

Figure 12 to Figure 15 provide few examples of basic EIM accesses to external memory devices with the timing parameters mentioned previously for specific control parameters settings.

Figure 12. Synchronous Memory Read Access, WSC=1

Figure 13. Synchronous Memory, Write Access, WSC=1, WBEA=0 and WADVN=0

Figure 14. Muxed Address/Data (A/D) Mode, Synchronous Write Access, WSC=6,ADVA=0, ADVN=1, and ADH=1

NOTE

In 32-bit muxed address/data (A/D) mode the 16 MSBs are driven on the data bus.

Figure 15. 16-Bit Muxed A/D Mode, Synchronous Read Access, WSC=7, RADVN=1, ADH=1, OEA=0

4.9.3.4 General EIM Timing-Asynchronous Mode

Figure 16 through Figure 20, and Table 38 help you determine timing parameters relative to the chip select (CS) state for asynchronous and DTACK EIM accesses with corresponding EIM bit fields and the timing parameters mentioned above.

Asynchronous read and write access length in cycles may vary from what is shown in Figure 16 through Figure 19 as RWSC, OEN & CSN is configured differently. See the i.MX 6SoloLite reference manual for the EIM programming model.

WE48	EIM_CSx_B Invalid to EIM_DTACK_B invalid	0	0	—	ns

¹ For more information on configuration parameters mentioned in this table, see the i.MX 6SoloLite reference manual.

² CSA means register setting for WCSA when in write operations or RCSA when in read operations.

³ CSN means register setting for WCSN when in write operations or RCSN when in read operations.

⁴ t means clock period from axi_clk frequency.

⁵ ADVA means register setting for WADVA when in write operations or RADVA when in read operations.

⁶ ADVN means register setting for WADVN when in write operations or RADVN when in read operations.

⁷ BE Assertion. This bitfield determines when BE signal is asserted during read cycles.

⁸ BE Negation. This bitfield determines when BE signal is negated during read cycles.

4.9.4 DDR SDRAM Specific Parameters (DDR3 and LPDDR2)

4.9.4.1 DDR3 Parameters

Figure 22 shows the DDR3 basic timing diagram with the timing parameters provided in Table 39.

Figure 22. DDR3 Command and Address Timing Diagram

Table 39. DDR3 Timing Parameters

ID	Parameter	Symbol	CK = 400 MHz		Unit
			Min	Max	
DDR1	DRAM_SDCLKx_P clock high-level width	tCH	0.47	0.53	tCK
DDR2	DRAM_SDCLKx_P clock low-level width	tCL	0.47	0.53	tCK
DDR4	DRAM_CSx_B, DRAM_RAS_B, DRAM_CAS_B, DRAM_SDCKE, DRAM_SDWE_B, DRAM_SDODTx setup time	tIS	800	—	ps
DDR5	DRAM_CSx_B, DRAM_RAS_B, DRAM_CAS_B, DRAM_SDCKE, DRAM_SDWE_B, DRAM_SDODTx hold time	tIH	580	—	ps
DDR6	Address output setup time	tIS	800	—	ps
DDR7	Address output hold time	tIH	580	—	ps

¹ All measurements are in reference to Vref level.

² Measurements were done using balanced load and 25 Ω resistor from outputs to VDD_REF.

Figure 23 shows the DDR3 write timing diagram. The timing parameters for this diagram appear in Table 40.

Figure 23. DDR3 Write Cycle

Table 40. DDR3 Write Cycle

ID	Parameter	Symbol	CK = 400MHz		Unit
			Min	Max	
DDR17	DRAM_DATAxx and DRAM_DQMx setup time to DRAM_SDQSx_P (differential strobe)	t _{DS}	420	—	ps
DDR18	DRAM_DATAxx and DRAM_DQMx hold time to DRAM_SDQSx_P (differential strobe)	t _{DH}	345	—	ps
DDR21	DRAM_SDQSx_P latching rising transitions to associated clock edges	t _{DQSS}	-0.25	+0.25	tCK
DDR22	DRAM_SDQSx_P high level width	t _{DQSH}	0.45	0.55	tCK
DDR23	DRAM_SDQSx_P low level width	t _{DQSL}	0.45	0.55	tCK

¹ To receive the reported setup and hold values, write calibration should be performed in order to locate the DRAM_SDQSx_P in the middle of DRAM_DATAxx window.

² All measurements are in reference to Vref level.

³ Measurements were taken using balanced load and 25 Ω resistor from outputs to DRAM_VREF.

Figure 24 shows the DDR3 read timing diagram. The timing parameters for this diagram appear in Table 41.

Figure 24. DDR3 Read Cycle

Table 41. DDR3 Read Cycle

ID	Parameter	Symbol	CK = 400 MHz		Unit
			Min	Max	
DDR26	Minimum required DRAM_DATAxx valid window width	—	450	—	ps

- ¹ To receive the reported setup and hold values, read calibration should be performed in order to locate the DRAM_SDQSx_P in the middle of DRAM_DATAxx window.
- ² All measurements are in reference to Vref level.
- ³ Measurements were done using balanced load and 25 Ω resistor from outputs to VDD_REF.

4.9.4.2 LPDDR2 Parameters

Figure 25 shows the LPDDR2 basic timing diagram. The timing parameters for this diagram appear in Table 42.

Figure 25. LPDDR2 Command and Address Timing Diagram

Table 42. LPDDR2 Timing Parameters

ID	Parameter	Symbol	CK = 400 MHz		Unit
			Min	Max	
LP1	SDRAM clock high-level width	t _{CH}	0.45	0.55	t _{CK}
LP2	SDRAM clock low-level width	t _{CL}	0.45	0.55	t _{CK}
LP3	DRAM_CSx_B, DRAM_SDCKEx setup time	t _{IS}	380	—	ps
LP4	DRAM_CSx_B, DRAM_SDCKEx hold time	t _{IH}	380	—	ps
LP3	DRAM_CAS_B setup time	t _{IS}	770	—	ps
LP4	DRAM_CAS_B hold time	t _{IH}	770	—	ps

¹ All measurements are in reference to V_{ref} level.

² Measurements were done using balanced load and 25 Ω resistor from outputs to DRAM_VREF.

Figure 26 shows the LPDDR2 write timing diagram. The timing parameters for this diagram appear in Table 43.

Figure 26. LPDDR2 Write Cycle

Table 43. LPDDR2 Write Cycle

ID	Parameter	Symbol	CK = 400 MHz		Unit
			Min	Max	
LP17	DRAM_DATAxx and DRAM_DQMx setup time to DRAM_SDQSx_P (differential strobe)	t _{DS}	375	—	ps
LP18	DRAM_DATAxx and DRAM_DQMx hold time to DRAM_SDQSx_P (differential strobe)	t _{DH}	375	—	ps
LP21	DRAM_SDQSx_P latching rising transitions to associated clock edges	t _{DQSS}	-0.25	+0.25	t _{CK}
LP22	DRAM_SDQSx_P high level width	t _{DQSH}	0.4	—	t _{CK}
LP23	DRAM_SDQSx_P low level width	t _{DQSL}	0.4	—	t _{CK}

Electrical Characteristics

- ¹ To receive the reported setup and hold values, write calibration should be performed in order to locate the DRAM_SDQS in the middle of DRAM_DATAxx window.
- ² All measurements are in reference to Vref level.
- ³ Measurements were done using balanced load and 25 Ω resistor from outputs to DRAM_VREF.

Figure 27 shows the LPDDR2 read timing diagram. The timing parameters for this diagram appear in Table 44.

Figure 27. LPDDR2 Read Cycle

Table 44. LPDDR2 Read Cycle

ID	Parameter	Symbol	CK = 400 MHz		Unit
			Min	Max	
LP26	Minimum required DRAM_DATAxx valid window width for LPDDR2	—	270	—	ps

- ¹ To receive the reported setup and hold values, read calibration should be performed in order to locate the DRAM_SDQSx_P in the middle of DRAM_DATA_xx window.
- ² All measurements are in reference to Vref level.
- ³ Measurements were done using balanced load and 25 Ω resistor from outputs to DRAM_VREF.

4.10 External Peripheral Interface Parameters

The following subsections provide information on external peripheral interfaces.

4.10.1 AUDMUX Timing Parameters

The AUDMUX provides a programmable interconnect logic for voice, audio, and data routing between internal serial interfaces (SSIs) and external serial interfaces (audio and voice codecs). The AC timing of AUDMUX external pins is governed by the SSI module. For more information, see the respective SSI electrical specifications found within this document.

4.10.2 CMOS Sensor Interface (CSI) Timing Parameters

4.10.2.0.1 Gated Clock Mode Timing

Figure 28 and Figure 29 shows the gated clock mode timings for CSI, and Table 45 describes the timing parameters (P1–P7) shown in the figures. A frame starts with a rising/falling edge on CSI_VSYNC (VSYNC), then CSI_HSYNC (HSYNC) is asserted and holds for the entire line. The pixel clock, CSI_PIXCLK (PIXCLK), is valid as long as HSYNC is asserted.

Figure 28. CSI Gated Clock Mode—Sensor Data at Falling Edge, Latch Data at Rising Edge

Figure 29. CSI Gated Clock Mode—Sensor Data at Rising Edge, Latch Data at Falling Edge

Table 45. CSI Gated Clock Mode Timing Parameters

ID	Parameter	Symbol	Min.	Max.	Units
P1	CSI_VSYNC to CSI_HSYNC time	tV2H	67.5	—	ns
P2	CSI_HSYNC setup time	tHsu	2	—	ns
P3	CSI DATA setup time	tDsu	2.5	—	ns
P4	CSI DATA hold time	tDh	1.2	—	ns
P5	CSI pixel clock high time	tCLKh	10	—	ns
P6	CSI pixel clock low time	tCLKl	10	—	ns
P7	CSI pixel clock frequency	fCLK	—	66 ± 10%	MHz

4.10.2.0.2 Ungated Clock Mode Timing

Figure 30 shows the ungated clock mode timings of CSI, and Table 46 describes the timing parameters (P1–P6) that are shown in the figure. In ungated mode the CSI_VSYNC and CSI_PIXCLK signals are used, and the CSI_HSYNC signal is ignored.

**Figure 30. CSI Ungated Clock Mode—Sensor Data at Falling Edge, Latch Data at Rising Edge****Table 46. CSI Ungated Clock Mode Timing Parameters**

ID	Parameter	Symbol	Min.	Max.	Units
P1	CSI_VSYNC to pixel clock time	tVSYNC	67.5	—	ns
P2	CSI DATA setup time	tDsu	2.5	—	ns
P3	CSI DATA hold time	tDh	1.2	—	ns
P4	CSI pixel clock high time	tCLKh	10	—	ns
P5	CSI pixel clock low time	tCLKl	10	—	ns
P6	CSI pixel clock frequency	fCLK	—	66 ± 10%	MHz

The CSI enables the chip to connect directly to external CMOS image sensors, which are classified as dumb or smart as follows:

- Dumb sensors only support traditional sensor timing (vertical sync (VSYNC) and horizontal sync (HSYNC)) and output-only Bayer and statistics data.
- Smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The following subsections describe the CSI timing in gated and ungated clock modes.

4.10.3 ECSPi Timing Parameters

This section describes the timing parameters of the ECSPi block. The ECSPi has separate timing parameters for master and slave modes.

4.10.3.1 ECSPi Master Mode Timing

Figure 31 depicts the timing of ECSPi in master mode and Table 47 lists the ECSPi master mode timing characteristics.

Figure 31. ECSPi Master Mode Timing Diagram

Table 47. ECSPi Master Mode Timing Parameters

ID	Parameter	Symbol	Min	Max	Unit
CS1	ECSPi_SCLK Cycle Time—Read • Slow group ¹ • Fast group ² ECSPi_SCLK Cycle Time—Write	t_{clk}	46 40 15	—	ns
CS2	ECSPi_SCLK High or Low Time—Read • Slow group ¹ • Fast group ² ECSPi_SCLK High or Low Time—Write	t_{sw}	22 20 7	—	ns
CS3	ECSPi_SCLK Rise or Fall ³	$t_{RISE/FALL}$	—	—	ns
CS4	ECSPi_SSx pulse width	t_{CSLH}	Half ECSPi period	—	ns
CS5	ECSPi_SSx Lead Time (CS setup time)	t_{SCS}	Half ECSPi_SCLK period - 4	—	ns

Table 47. ECSPi Master Mode Timing Parameters (continued)

ID	Parameter	Symbol	Min	Max	Unit
CS6	ECSPi _x _SS _x Lag Time (CS hold time)	t_{HCS}	Half ECSPi_SCLK period - 2	—	ns
CS7	ECSPi _x _MOSI Propagation Delay ($C_{LOAD} = 20$ pF)	t_{PDmosi}	-0.5	2	ns
CS8	ECSPi _x _MISO Setup Time • Slow group¹ • Fast group²	t_{Smiso}	— 14 12	—	ns
CS9	ECSPi _x _MISO Hold Time	t_{Hmiso}	0	—	ns
CS10	ECSPi _x _RDY to ECSPi _x _SS _x Time ⁴	t_{SDRY}	5	—	ns

¹ ECSPi slow group includes:
ECSPi2/EPDC_SDLE, ECSPi3/EPDC_D9, ECSPi4/EPDC_D1

² ECSPi fast group includes:
ECSPi1/LCD_DATA01, ECSPi1/ECSPi1_MISO, ECSPi2/LCD_DATA10, ECSPi2/ECSPi2_MISO, ECSPi3/AUDx_TXC,
ECSPi3/SD2_DAT1, ECSPi4/KEY_ROW1, ECSPi4/FEC_RX_DV

³ See specific I/O AC parameters [Section 4.7, “I/O AC Parameters.”](#)

⁴ ECSPi_x_RDY is sampled internally by ipg_clk and is asynchronous to all other eCSPi signals.

4.10.3.2 ECSPi Slave Mode Timing

Figure 32 depicts the timing of ECSPi in slave mode and Table 48 lists the ECSPi slave mode timing characteristics.

Figure 32. ECSPi Slave Mode Timing Diagram

Table 48. ECSPi Slave Mode Timing Parameters

ID	Parameter	Symbol	Min	Max	Unit
CS1	ECSPi_SCLK Cycle Time–Read ECSPi_SCLK Cycle Time–Write	t_{clk}	40 15	—	ns
CS2	ECSPi_SCLK High or Low Time–Read ECSPi_SCLK High or Low Time–Write	t_{sw}	20 7	—	ns
CS4	ECSPi_SSx pulse width	t_{CSLH}	Half SCLK period	—	ns
CS5	ECSPi_SSx Lead Time (CS setup time)	t_{SCS}	5	—	ns
CS6	ECSPi_SSx Lag Time (CS hold time)	t_{HCS}	5	—	ns
CS7	ECSPi_MOSI Setup Time	t_{smosi}	4	—	ns
CS8	ECSPi_MOSI Hold Time	t_{Hmosi}	4	—	ns
CS9	ECSPi_MISO Propagation Delay ($C_{LOAD} = 20$ pF)	t_{PDmiso}	4	17	ns

4.10.4 Ultra High Speed SD/SDIO/MMC Host Interface (uSDHC) AC Timing

This section describes the electrical information of the uSDHC, which includes SD/eMMC4.3 (Single Data Rate) timing and eMMC4.4/4.41 (Dual Data Rate) timing.

4.10.4.1 SD/eMMC4.3 (Single Data Rate) AC Timing

Figure 33 depicts the timing of SD/eMMC4.3, and Table 49 lists the SD/eMMC4.3 timing characteristics.

Figure 33. SD/eMMC4.3 Timing

Table 49. SD/eMMC4.3 Interface Timing Specification

ID	Parameter	Symbols	Min	Max	Unit
Card Input Clock					
SD1	Clock Frequency (Low Speed)	f_{PP}^1	0	400	kHz
	Clock Frequency (SD/SDIO Full Speed/High Speed)	f_{PP}^2	0	25/50	MHz
	Clock Frequency (MMC Full Speed/High Speed)	f_{PP}^3	0	20/52	MHz
	Clock Frequency (Identification Mode)	f_{OD}	100	400	kHz
SD2	Clock Low Time	t_{WL}	7	—	ns
SD3	Clock High Time	t_{WH}	7	—	ns
eSDHC Output/Card Inputs SDx_CMD, SDx_DATAx (Reference to CLK)					
SD6	eSDHC Output Delay	t_{OD}	-6.6	3.6	ns
eSDHC Input/Card Outputs SDx_CMD, SDx_DATAx (Reference to CLK)					
SD7	eSDHC Input Setup Time	t_{ISU}	2.5	—	ns
SD8	eSDHC Input Hold Time ⁴	t_{IH}	1.5	—	ns

¹ In low speed mode, card clock must be lower than 400 kHz, voltage ranges from 2.7 to 3.6 V.

² In normal (full) speed mode for SD/SDIO card, clock frequency can be any value between 0–25 MHz. In high-speed mode, clock frequency can be any value between 0–50 MHz.

³ In normal (full) speed mode for MMC card, clock frequency can be any value between 0–20 MHz. In high-speed mode, clock frequency can be any value between 0–52 MHz.

⁴ To satisfy hold timing, the delay difference between clock input and cmd/data input must not exceed 2 ns.

4.10.4.2 eMMC4.4/4.41 (Dual Data Rate) eSDHCv3 AC Timing

Figure 34 depicts the timing of eMMC4.4/4.41. Table 50 lists the eMMC4.4/4.41 timing characteristics. Be aware that only SDx_DATAx is sampled on both edges of the clock (not applicable to SDx_CMD).

Figure 34. eMMC4.4/4.41 Timing

Table 50. eMMC4.4/4.41 Interface Timing Specification

ID	Parameter	Symbols	Min	Max	Unit
Card Input Clock					
SD1	Clock Frequency (eMMC4.4/4.41 DDR)	f_{PP}	0	52	MHz
SD1	Clock Frequency (SD3.0 DDR)	f_{PP}	0	50	MHz
uSDHC Output / Card Inputs SD_CMD, SD_DATAx (Reference to CLK)					
SD2	uSDHC Output Delay	t_{OD}	2.5	7.1	ns
uSDHC Input / Card Outputs SD_CMD, SD_DATAx (Reference to CLK)					
SD3	uSDHC Input Setup Time	t_{ISU}	2.6	—	ns
SD4	uSDHC Input Hold Time	t_{IH}	1.5	—	ns

4.10.4.3 SDR50/SDR104 AC Timing

Figure 35 depicts the timing of SDR50/SDR104, and Table 49 lists the SDR50/SDR104 timing characteristics.

Figure 35. SDR50/SDR104 Timing

Table 51. SDR50/SDR104 Interface Timing Specification

ID	Parameter	Symbols	Min	Max	Unit
Card Input Clock					
SD1	Clock Frequency Period	t_{CLK}	4.8	—	ns
SD2	Clock Low Time	t_{CL}	$0.3 \times t_{CLK}$	$0.7 \times t_{CLK}$	ns
SD2	Clock High Time	t_{CH}	$0.3 \times t_{CLK}$	$0.7 \times t_{CLK}$	ns
uSDHC Output/Card Inputs SD_CMD, SD_DATAx in SDR50 (Reference to CLK)					
SD4	uSDHC Output Delay	t_{OD}	-3	1	ns
uSDHC Output/Card Inputs SD_CMD, SD_DATAx in SDR104 (Reference to CLK)					
SD5	uSDHC Output Delay ¹	t_{OD}	-1.6	1	ns
uSDHC Input/Card Outputs SD_CMD, SD_DATAx in SDR50 (Reference to CLK)					
SD6	uSDHC Input Setup Time	t_{ISU}	2.5	—	ns
SD7	uSDHC Input Hold Time	t_{IH}	1.5	—	ns
uSDHC Input/Card Outputs SD_CMD, SD_DATAx in SDR104 (Reference to CLK)²					
SD8	Card Output Data Window	t_{ODW}	$0.5 \times t_{CLK}$	—	ns

¹ If using KEY_COL1, KEY_ROW1, KEY_COL2 and KEY_ROW2 for SD3_DATA4–SD3_DATA7, note the difference in timing: t_{od} minimum is -1.1 and t_{od} maximum is 1.5.

² Data window in SDR100 mode is variable.

4.10.5 FEC AC Timing Parameters

This section describes the electrical information of the Fast Ethernet Controller (FEC) module. The FEC is designed to support both 10 and 100 Mbps Ethernet/IEEE 802.3 networks. An external transceiver interface and transceiver function are required to complete the interface to the media. The FEC supports the 10/100 Mbps RMII (10 pins in total) and the 10 Mbps (only 7-wire interface, which uses 7 of the RMII pins), for connection to an external Ethernet transceiver. For the pin list of RMII and 7-wire, see the i.MX 6SoloLite Reference Manual.

This section describes the AC timing specifications of the FEC. The RMII signals are compatible with transceivers operating at a voltage of 3.3 V.

4.10.5.1 RMII Mode Timing

In RMII mode, FEC_TX_CLK is used as the REF_CLK which is a 50 MHz $\pm$ 50 ppm continuous reference clock. FEC_RX_DV is used as the CRS_DV in RMII, and other signals under RMII mode include FEC_TX_EN, FEC_TX_DATA[1:0], FEC_RX_DATA[1:0] and optional FEC_RX_ER.

The RMII mode timings are shown in [Table 52](#) and [Figure 36](#).

Table 52. RMII Signal Timing

No.	Characteristics ¹	Min	Max	Unit
M16	REF_CLK(FEC_TX_CLK) pulse width high	35%	65%	REF_CLK period
M17	REF_CLK(FEC_TX_CLK) pulse width low	35%	65%	REF_CLK period
M18	REF_CLK to FEC_TX_DATA[1:0], FEC_TX_EN invalid	2	—	ns
M19	REF_CLK to FEC_TX_DATA[1:0], FEC_TX_EN valid	—	16	ns
M20	FEC_RX_DATA[1:0], CRS_DV(FEC_RX_DV), FEC_RX_ER to REF_CLK setup	4	—	ns
M21	REF_CLK to FEC_RX_DATA[1:0], FEC_RX_DV, FEC_RX_ER hold	2	—	ns

¹ Test conditions: 25pF on each output signal.

Figure 36. RMI Mode Signal Timing Diagram

4.10.6 I²C Module Timing Parameters

This section describes the timing parameters of the I²C module. Figure 37 depicts the timing of I²C module, and Table 53 lists the I²C module timing characteristics.

Figure 37. I²C Bus TimingTable 53. I²C Module Timing Parameters

ID	Parameter	Standard Mode		Fast Mode		Unit
		Min	Max	Min	Max	
IC1	I2Cx_SCL cycle time	10	—	2.5	—	μs
IC2	Hold time (repeated) START condition	4.0	—	0.6	—	μs
IC3	Set-up time for STOP condition	4.0	—	0.6	—	μs
IC4	Data hold time	0 ¹	3.45 ²	0 ¹	0.9 ²	μs
IC5	HIGH Period of I2Cx_SCL	4.0	—	0.6	—	μs
IC6	LOW Period of the I2Cx_SCL	4.7	—	1.3	—	μs

Table 53. I²C Module Timing Parameters (continued)

ID	Parameter	Standard Mode		Fast Mode		Unit
		Min	Max	Min	Max	
IC7	Set-up time for a repeated START condition	4.7	—	0.6	—	μs
IC8	Data set-up time	250	—	100 ³	—	ns
IC9	Bus free time between a STOP and START condition	4.7	—	1.3	—	μs
IC10	Rise time of both I2Cx_SDA and I2Cx_SCL signals	—	1000	$20 + 0.1C_b^4$	300	ns
IC11	Fall time of both I2Cx_SDA and I2Cx_SCL signals	—	300	$20 + 0.1C_b^4$	300	ns
IC12	Capacitive load for each bus line (C_b)	—	400	—	400	pF

¹ A device must internally provide a hold time of at least 300 ns for I2Cx_SDA signal in order to bridge the undefined region of the falling edge of I2Cx_SCL.

² The maximum hold time has only to be met if the device does not stretch the LOW period (ID no IC5) of the I2Cx_SCL signal.

³ A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement of Set-up time (ID No IC7) of 250 ns must be met. This automatically is the case if the device does not stretch the LOW period of the I2Cx_SCL signal. If such a device does stretch the LOW period of the I2Cx_SCL signal, it must output the next data bit to the I2Cx_SDA line $\text{max_rise_time (IC9)} + \text{data_setup_time (IC7)} = 1000 + 250 = 1250$ ns (according to the Standard-mode I2C-bus specification) before the I2Cx_SCL line is released.

⁴ C_b = total capacitance of one bus line in pF.

4.10.7 Pulse Width Modulator (PWM) Timing Parameters

This section describes the electrical information of the PWM. The PWM can be programmed to select one of three clock signals as its source frequency. The selected clock signal is passed through a prescaler before being input to the counter. The output is available at the pulse-width modulator output (PWMx_OUT) external pin (see external signals table in the i.MX 6SoloLite reference manual for PWM pin assignments).

Figure 38 depicts the timing of the PWM, and Table 54 lists the PWM timing parameters.

Figure 38. PWM Timing

Table 54. PWM Output Timing Parameters

Reference Number	Parameter	Min	Max	Unit
1	System CLK frequency ¹	0	ipg_clk	MHz

Table 54. PWM Output Timing Parameters (continued)

Reference Number	Parameter	Min	Max	Unit
2a	Clock high time	12.29	—	ns
2b	Clock low time	9.91	—	ns

¹ CL of PWMx_OUT = 30 pF

4.10.8 SCAN JTAG Controller (SJC) Timing Parameters

Figure 39 depicts the SJC test clock input timing. Figure 40 depicts the SJC boundary scan timing. Figure 41 depicts the SJC test access port. Signal parameters are listed in Table 55.

Figure 39. Test Clock Input Timing Diagram

Figure 40. Boundary Scan (JTAG) Timing Diagram

Figure 41. Test Access Port Timing Diagram

Figure 42. $\overline{\text{TRST}}$ Timing Diagram

Table 55. JTAG Timing

ID	Parameter ^{1,2}	All Frequencies		Unit
		Min	Max	
SJ0	JTAG_TCK frequency of operation $1/(3 \cdot T_{DC})^1$	0.001	22	MHz
SJ1	JTAG_TCK cycle time in crystal mode	45	—	ns
SJ2	JTAG_TCK clock pulse width measured at V_M^2	22.5	—	ns
SJ3	JTAG_TCK rise and fall times	—	3	ns
SJ4	Boundary scan input data set-up time	5	—	ns
SJ5	Boundary scan input data hold time	24	—	ns
SJ6	JTAG_TCK low to output data valid	—	40	ns
SJ7	JTAG_TCK low to output high impedance	—	40	ns
SJ8	JTAG_TMS, JTAG_TDI data set-up time	5	—	ns
SJ9	JTAG_TMS, JTAG_TDI data hold time	25	—	ns

Table 55. JTAG Timing (continued)

ID	Parameter ^{1,2}	All Frequencies		Unit
		Min	Max	
SJ10	JTAG_TCK low to JTAG_TDO data valid	—	44	ns
SJ11	JTAG_TCK low to JTAG_TDO high impedance	—	44	ns
SJ12	JTAG_TRSTB assert time	100	—	ns
SJ13	JTAG_TRSTB set-up time to JTAG_TCK low	40	—	ns

¹ T_{DC} = target frequency of SJC² V_M = mid-point voltage

4.10.9 SPDIF Timing Parameters

The Sony/Philips Digital Interconnect Format (SPDIF) data is sent using the bi-phase marking code. When encoding, the SPDIF data signal is modulated by a clock that is twice the bit rate of the data signal.

Table 56 and Figure 43 and Figure 44 show SPDIF timing parameters for the Sony/Philips Digital Interconnect Format (SPDIF), including the timing of the modulating Rx clock (SPDIF_SR_CLK) for SPDIF in Rx mode and the timing of the modulating Tx clock (SPDIF_ST_CLK) for SPDIF in Tx mode.

Table 56. SPDIF Timing Parameters

Characteristics	Symbol	Timing Parameter Range		Unit
		Min	Max	
SPDIF_IN Skew: asynchronous inputs, no specs apply	—	—	0.7	ns
SPDIF_OUT output (Load = 50pf)				
• Skew	—	—	1.5	ns
• Transition rising	—	—	24.2	
• Transition falling	—	—	31.3	
SPDIF_OUT output (Load = 30pf)				
• Skew	—	—	1.5	ns
• Transition rising	—	—	13.6	
• Transition falling	—	—	18.0	
Modulating Rx clock (SPDIF_SR_CLK) period	srckp	40.0	—	ns
SPDIF_SR_CLK high period	srckph	16.0	—	ns
SPDIF_SR_CLK low period	srckpl	16.0	—	ns
Modulating Tx clock (SPDIF_ST_CLK) period	stclkp	40.0	—	ns
SPDIF_ST_CLK high period	stclkph	16.0	—	ns
SPDIF_ST_CLK low period	stclkpl	16.0	—	ns

Figure 43. SRCK Timing Diagram

Figure 44. STCLK Timing Diagram

4.10.10 SSI Timing Parameters

This section describes the timing parameters of the SSI module. The connectivity of the serial synchronous interfaces are summarized in [Table 57](#).

Table 57. AUDMUX Port Allocation

Port	Signal Nomenclature	Type and Access
AUDMUX port 1	SSI 1	Internal
AUDMUX port 2	SSI 2	Internal
AUDMUX port 3	AUD3	External – AUD3 I/O
AUDMUX port 4	AUD4	External – I2C2 and LCD, or ECSP11, or SD2 I/O through IOMUXC
AUDMUX port 5	AUD5	External – EPDC or SD3 I/O through IOMUXC
AUDMUX port 6	AUD6	External – FEC or KEY_ROW and KEY_COL through IOMUXC
AUDMUX port 7	SSI 3	Internal

NOTE

The terms WL and BL used in the timing diagrams and tables refer to Word Length (WL) and Bit Length (BL).

4.10.10.1 SSI Transmitter Timing with Internal Clock

Figure 45 depicts the SSI transmitter internal clock timing and Table 58 lists the timing parameters for the SSI transmitter internal clock.

Figure 45. SSI Transmitter Internal Clock Timing Diagram

Table 58. SSI Transmitter Timing with Internal Clock

ID	Parameter	Min	Max	Unit
Internal Clock Operation				
SS1	AUDx_TXC/AUDx_RXC clock period	81.4	—	ns
SS2	AUDx_TXC/AUDx_RXC clock high period	36.0	—	ns
SS4	AUDx_TXC/AUDx_RXC clock low period	36.0	—	ns
SS6	AUDx_TXC high to AUDx_TXFS (bl) high	—	15.0	ns
SS8	AUDx_TXC high to AUDx_TXFS (bl) low	—	15.0	ns
SS10	AUDx_TXC high to AUDx_TXFS (wl) high	—	15.0	ns
SS12	AUDx_TXC high to AUDx_TXFS (wl) low	—	15.0	ns
SS14	AUDx_TXC/AUDx_RXC Internal AUDx_TXFS rise time	—	6.0	ns
SS15	AUDx_TXC/AUDx_RXC Internal AUDx_TXFS fall time	—	6.0	ns
SS16	AUDx_TXC high to AUDx_TXD valid from high impedance	—	15.0	ns
SS17	AUDx_TXC high to AUDx_TXD high/low	—	15.0	ns
SS18	AUDx_TXC high to AUDx_TXD high impedance	—	15.0	ns

Table 58. SSI Transmitter Timing with Internal Clock (continued)

ID	Parameter	Min	Max	Unit
Synchronous Internal Clock Operation				
SS42	AUDx_RXD setup before AUDx_TXC falling	10.0	—	ns
SS43	AUDx_RXD hold after AUDx_TXC falling	0.0	—	ns

NOTE

- All the timings for the SSI are given for a non-inverted serial clock polarity (TXC/RXC = 0) and a non-inverted frame sync (TXFS/RXFS = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the clock signal TXC/RXC and/or the frame sync TXFS/RXFS shown in the tables and in the figures.
- All timings are on Audiomux Pads when SSI is used for data transfer.
- The terms, WL and BL, refer to Word Length(WL) and Bit Length(BL).
- For internal Frame Sync operation using external clock, the FS timing is same as that of TXD (for example, during AC97 mode of operation).

4.10.10.2 SSI Receiver Timing with Internal Clock

Figure 46 depicts the SSI receiver internal clock timing and Table 59 lists the timing parameters for the receiver timing with the internal clock.

**Figure 46. SSI Receiver Internal Clock Timing Diagram**

Table 59. SSI Receiver Timing with Internal Clock

ID	Parameter	Min	Max	Unit
Internal Clock Operation				
SS1	AUDx_TXC/AUDx_RXC clock period	81.4	—	ns
SS2	AUDx_TXC/AUDx_RXC clock high period	36.0	—	ns
SS3	AUDx_TXC/AUDx_RXC clock rise time	—	6.0	ns
SS4	AUDx_TXC/AUDx_RXC clock low period	36.0	—	ns
SS5	AUDx_TXC/AUDx_RXC clock fall time	—	6.0	ns
SS7	AUDx_RXC high to AUDx_TXFS (bl) high	—	15.0	ns
SS9	AUDx_RXC high to AUDx_TXFS (bl) low	—	15.0	ns
SS11	AUDx_RXC high to AUDx_TXFS (wl) high	—	15.0	ns
SS13	AUDx_RXC high to AUDx_TXFS (wl) low	—	15.0	ns
SS20	AUDx_RXD setup time before AUDx_RXC low	10.0	—	ns
SS21	AUDx_RXD hold time after AUDx_RXC low	0.0	—	ns
Oversampling Clock Operation				
SS47	Oversampling clock period	15.04	—	ns
SS48	Oversampling clock high period	6.0	—	ns
SS49	Oversampling clock rise time	—	3.0	ns
SS50	Oversampling clock low period	6.0	—	ns
SS51	Oversampling clock fall time	—	3.0	ns

NOTE

- All the timings for the SSI are given for a non-inverted serial clock polarity (TXC/RXC = 0) and a non-inverted frame sync (TXFS/RXFS = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the clock signal TXC/RXC and/or the frame sync TXFS/RXFS shown in the tables and in the figures.
- All timings are on Audiomux Pads when SSI is being used for data transfer.
- The terms, WL and BL, refer to Word Length(WL) and Bit Length(BL).
- For internal Frame Sync operation using external clock, the FS timing is same as that of TXD (for example, during AC97 mode of operation).

4.10.10.3 SSI Transmitter Timing with External Clock

Figure 47 depicts the SSI transmitter external clock timing and Table 60 lists the timing parameters for the transmitter timing with the external clock.

Figure 47. SSI Transmitter External Clock Timing Diagram

Table 60. SSI Transmitter Timing with External Clock

ID	Parameter	Min	Max	Unit
External Clock Operation				
SS22	AUDx_TXC/AUDx_RXC clock period	81.4	—	ns
SS23	AUDx_TXC/AUDx_RXC clock high period	36.0	—	ns
SS24	AUDx_TXC/AUDx_RXC clock rise time	—	6.0	ns
SS25	AUDx_TXC/AUDx_RXC clock low period	36.0	—	ns
SS26	AUDx_TXC/AUDx_RXC clock fall time	—	6.0	ns
SS27	AUDx_TXC high to AUDx_TXFS (bl) high	–10.0	15.0	ns
SS29	AUDx_TXC high to AUDx_TXFS (bl) low	10.0	—	ns
SS31	AUDx_TXC high to AUDx_TXFS (wl) high	–10.0	15.0	ns
SS33	AUDx_TXC high to AUDx_TXFS (wl) low	10.0	—	ns
SS37	AUDx_TXC high to AUDx_TXD valid from high impedance	—	15.0	ns
SS38	AUDx_TXC high to AUDx_TXD high/low	—	15.0	ns
SS39	AUDx_TXC high to AUDx_TXD high impedance	—	15.0	ns

Table 60. SSI Transmitter Timing with External Clock (continued)

ID	Parameter	Min	Max	Unit
Synchronous External Clock Operation				
SS44	AUDx_RXD setup before AUDx_TXC falling	10.0	—	ns
SS45	AUDx_RXD hold after AUDx_TXC falling	2.0	—	ns
SS46	AUDx_RXD rise/fall time	—	6.0	ns

NOTE

- All the timings for the SSI are given for a non-inverted serial clock polarity (TXC/RXC = 0) and a non-inverted frame sync (TXFS/RXFS = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the clock signal TXC/RXC and/or the frame sync TXFS/RXFS shown in the tables and in the figures.
- All timings are on AUDMUX Pads when SSI is used for data transfer.
- The terms WL and BL refer to Word Length (WL) and Bit Length (BL).
- For internal Frame Sync operation using external clock, the FS timing is same as that of TXD (for example, during AC97 mode of operation).

4.10.10.4 SSI Receiver Timing with External Clock

Figure 48 depicts the SSI receiver external clock timing and Table 61 lists the timing parameters for the receiver timing with the external clock.

**Figure 48. SSI Receiver External Clock Timing Diagram**

Table 61. SSI Receiver Timing with External Clock

ID	Parameter	Min	Max	Unit
External Clock Operation				
SS22	AUDx_TXC/AUDx_RXC clock period	81.4	—	ns
SS23	AUDx_TXC/AUDx_RXC clock high period	36	—	ns
SS24	AUDx_TXC/AUDx_RXC clock rise time	—	6.0	ns
SS25	AUDx_TXC/AUDx_RXC clock low period	36	—	ns
SS26	AUDx_TXC/AUDx_RXC clock fall time	—	6.0	ns
SS28	AUDx_RXC high to AUDx_TXFS (bl) high	−10	15.0	ns
SS30	AUDx_RXC high to AUDx_TXFS (bl) low	10	—	ns
SS32	AUDx_RXC high to AUDx_TXFS (wl) high	−10	15.0	ns
SS34	AUDx_RXC high to AUDx_TXFS (wl) low	10	—	ns
SS35	AUDx_TXC/AUDx_RXC External AUDx_TXFS rise time	—	6.0	ns
SS36	AUDx_TXC/AUDx_RXC External AUDx_TXFS fall time	—	6.0	ns
SS40	AUDx_RXD setup time before AUDx_RXC low	10	—	ns
SS41	AUDx_RXD hold time after AUDx_RXC low	2	—	ns

NOTE

- All the timings for the SSI are given for a non-inverted serial clock polarity (TXC/RXC=0) and a non-inverted frame sync (TXFS/RXFS=0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the clock signal TXC/RXC and/or the frame sync TXFS/RXFS shown in the tables and in the figures.
- All timings are on AUDMUX Pads when SSI is being used for data transfer.
- The terms, WL and BL, refer to Word Length(WL) and Bit Length(BL).
- For internal Frame Sync operation using external clock, the FS timing is same as that of TXD (for example, during AC97 mode of operation).

4.10.11 UART I/O Configuration and Timing Parameters

4.10.11.1 UART RS-232 I/O Configuration in Different Modes

The i.MX 6SoloLite UART interfaces can serve both as DTE or DCE device. This can be configured by the DCEDTE control bit (default 0 – DCE mode). Table 62 shows the UART I/O configuration based on the enabled mode.

Table 62. UART I/O Configuration vs. Mode

Port	DTE Mode		DCE Mode	
	Direction	Description	Direction	Description
UART_RTS_B	Output	RTS from DTE to DCE	Input	RTS from DTE to DCE
UART_CTS_B	Input	CTS from DCE to DTE	Output	CTS from DCE to DTE
UART_DTR_B	Output	DTR from DTE to DCE	Input	DTR from DTE to DCE
UART_DSR_B	Input	DSR from DCE to DTE	Output	DSR from DCE to DTE
UART_DCD_B	Input	DCD from DCE to DTE	Output	DCD from DCE to DTE
UART_RI_B	Input	RING from DCE to DTE	Output	RING from DCE to DTE
UART_TX_DATA	Input	Serial data from DCE to DTE	Output	Serial data from DCE to DTE
UART_RX_DATA	Output	Serial data from DTE to DCE	Input	Serial data from DTE to DCE

4.10.11.2 UART RS-232 Serial Mode Timing

The following sections describe the electrical information of the UART module in the RS-232 mode.

4.10.11.2.1 UART Transmitter

Figure 49 depicts the transmit timing of UART in the RS-232 serial mode, with 8 data bit/1 stop bit format. Table 63 lists the UART RS-232 serial mode transmit timing characteristics.

Figure 49. UART RS-232 Serial Mode Transmit Timing Diagram

Table 63. RS-232 Serial Mode Transmit Timing Parameters

ID	Parameter	Symbol	Min	Max	Unit
UA1	Transmit Bit Time	t_{Tbit}	$1/F_{baud_rate}^1 - T_{ref_clk}^2$	$1/F_{baud_rate} + T_{ref_clk}$	—

¹ F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is $(ipg_perclk \text{ frequency})/16$.

² T_{ref_clk} : The period of UART reference clock ref_clk (ipg_perclk after RFDIV divider).

4.10.11.2.2 UART Receiver

Figure 50 depicts the RS-232 serial mode receive timing with 8 data bit/1 stop bit format. Table 64 lists serial mode receive timing characteristics.

Figure 50. UART RS-232 Serial Mode Receive Timing Diagram

Table 64. RS-232 Serial Mode Receive Timing Parameters

ID	Parameter	Symbol	Min	Max	Unit
UA2	Receive Bit Time ¹	t_{Rbit}	$1/F_{baud_rate}^2 - 1/(16 \times F_{baud_rate})$	$1/F_{baud_rate} + 1/(16 \times F_{baud_rate})$	—

¹ The UART receiver can tolerate $1/(16 \times F_{baud_rate})$ tolerance in each bit. But accumulation tolerance in one frame must not exceed $3/(16 \times F_{baud_rate})$.

² F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is $(ipg_perclk \text{ frequency})/16$.

4.10.11.2.3 UART IrDA Mode Timing

The following subsections give the UART transmit and receive timings in IrDA mode.

UART IrDA Mode Transmitter

Figure 51 depicts the UART IrDA mode transmit timing, with 8 data bit/1 stop bit format. Table 65 lists the transmit timing characteristics.

Figure 51. UART IrDA Mode Transmit Timing Diagram

Table 65. IrDA Mode Transmit Timing Parameters

ID	Parameter	Symbol	Min	Max	Unit
UA3	Transmit Bit Time in IrDA mode	t_{TIRbit}	$1/F_{baud_rate}^1 - T_{ref_clk}^2$	$1/F_{baud_rate} + T_{ref_clk}$	—
UA4	Transmit IR Pulse Duration	$t_{TIRpulse}$	$(3/16) \times (1/F_{baud_rate}) - T_{ref_clk}$	$(3/16) \times (1/F_{baud_rate}) + T_{ref_clk}$	—

¹ F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is $(ipg_perclk \text{ frequency})/16$.

² T_{ref_clk} : The period of UART reference clock ref_clk (ipg_perclk after RFDIV divider).

UART IrDA Mode Receiver

Figure 52 depicts the UART IrDA mode receive timing, with 8 data bit/1 stop bit format. Table 66 lists the receive timing characteristics.

Figure 52. UART IrDA Mode Receive Timing Diagram

Table 66. IrDA Mode Receive Timing Parameters

ID	Parameter	Symbol	Min	Max	Unit
UA5	Receive Bit Time ¹ in IrDA mode	t_{RIRbit}	$1/F_{baud_rate}^2 - 1/(16 \times F_{baud_rate})$	$1/F_{baud_rate} + 1/(16 \times F_{baud_rate})$	—
UA6	Receive IR Pulse Duration	$t_{RIRpulse}$	1.41 μ s	$(5/16) \times (1/F_{baud_rate})$	—

¹ The UART receiver can tolerate $1/(16 \times F_{baud_rate})$ tolerance in each bit. But accumulation tolerance in one frame must not exceed $3/(16 \times F_{baud_rate})$.

² F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is $(ipg_perclk \text{ frequency})/16$.

4.10.12 USB HSIC Timings

This section describes the electrical information of the USB HSIC port.

NOTE

HSIC is the DDR signal, the following timing parameters are for both rising and falling edge.

4.10.12.1 Transmit Timing

Figure 53. USB HSIC Transmit Waveform

Table 67. USB HSIC Transmit Parameters

Name	Parameter	Min	Max	Unit	Comment
Tstrobe	Strobe period	4.166	4.167	ns	—
Todelay	Data output delay time	550	1350	ps	Measured at 50% point
Tslew	Strobe/data rising/falling time	0.7	2	V/ns	Averaged from 30% – 70% points

4.10.12.2 Receive Timing

Figure 54. USB HSIC Receive Waveform

Table 68. USB HSIC Receive Parameters¹

Name	Parameter	Min	Max	Unit	Comment
Tstrobe	Strobe period	4.166	4.167	ns	—
Thold	Data hold time	300	—	ps	Measured at 50% point
Tsetup	Data setup time	365	—	ps	Measured at 50% point
Tslew	Strobe/data rising/falling time	0.7	2	V/ns	Averaged from 30% – 70% points

¹ The timings in the table are guaranteed when:
 —AC I/O voltage is between 0.9x to 1x of the I/O supply
 —DDR_SEL configuration bits of the I/O are set to (10)b

4.10.13 USB PHY Parameters

This section describes the USB-OTG PHY and the USB Host port PHY parameters.

The USB PHY meets the electrical compliance requirements defined in the Universal Serial Bus Revision 2.0 OTG, USB Host.

5 Boot Mode Configuration

This section provides information on boot mode configuration pins allocation and boot devices interfaces allocation.

5.1 Boot Mode Configuration Pins

Table 69 provides boot options, functionality, fuse values, and associated pins. Several input pins are also sampled at reset and can be used to override fuse values, depending on the value of BT_FUSE_SEL fuse. The boot option pins are in effect when BT_FUSE_SEL fuse is '0' (cleared, which is the case for an unblown fuse). For detailed boot mode options configured by the boot mode pins, see the i.MX 6SoloLite Fuse Map document and the System Boot chapter of the i.MX 6SoloLite reference manual.

Table 69. Fuses and Associated Pins Used for Boot

Ball Name	Direction at Reset	eFuse Name
Boot Mode Selection		
BOOT_MODE1	Input	Boot Mode Selection
BOOT_MODE0	Input	Boot Mode Selection
Boot Options¹		
LCD_DAT0	Input	BOOT_CFG1[0]
LCD_DAT1	Input	BOOT_CFG1[1]
LCD_DAT2	Input	BOOT_CFG1[2]
LCD_DAT3	Input	BOOT_CFG1[3]
LCD_DAT4	Input	BOOT_CFG1[4]
LCD_DAT5	Input	BOOT_CFG1[5]
LCD_DAT6	Input	BOOT_CFG1[6]
LCD_DAT7	Input	BOOT_CFG1[7]
LCD_DAT8	Input	BOOT_CFG2[0]
LCD_DAT9	Input	BOOT_CFG2[1]
LCD_DAT10	Input	BOOT_CFG2[2]
LCD_DAT11	Input	BOOT_CFG2[3]
LCD_DAT12	Input	BOOT_CFG2[4]
LCD_DAT13	Input	BOOT_CFG2[5]
LCD_DAT14	Input	BOOT_CFG2[6]
LCD_DAT15	Input	BOOT_CFG2[7]
LCD_DAT16	Input	BOOT_CFG4[0]
LCD_DAT17	Input	BOOT_CFG4[1]
LCD_DAT18	Input	BOOT_CFG4[2]

Table 69. Fuses and Associated Pins Used for Boot (continued)

Ball Name	Direction at Reset	eFuse Name
LCD_DAT19	Input	BOOT_CFG4[3]
LCD_DAT20	Input	BOOT_CFG4[4]
LCD_DAT21	Input	BOOT_CFG4[5]
LCD_DAT22	Input	BOOT_CFG4[6]
LCD_DAT23	Input	BOOT_CFG4[7]

¹ Pin value overrides fuse settings for BT_FUSE_SEL = '0'. Signal Configuration as Fuse Override Input at Power Up. These are special I/O lines that control the boot up configuration during product development. In production, the boot configuration can be controlled by fuses.

5.2 Boot Devices Interfaces Allocation

Table 70 lists the interfaces that can be used by the boot process in accordance with the specific boot mode configuration. The table also describes the interface's specific modes and IOMUXC allocation, which are configured during boot when appropriate.

Table 70. Interfaces Allocation During Boot

Interface	IP Instance	Allocated Ball Names During Boot	Comment
SPI	ECSPI-1	ECSPI1_MISO, ECSPI1_MOSI, ECSPI1_SCLK, ECSPI1_SS0, I2C1_SCL, I2C1_SDA, ECSPI2_SS0	—

6 Package Information and Contact Assignments

This section includes the contact assignment information and mechanical package drawing.

6.1 Updated Signal Naming Convention

The signal names of the i.MX6 series of products have been standardized to better align the signal names within the family and across the documentation. Some of the benefits of these changes are as follows:

- The names are unique within the scope of an SoC and within the series of products
- Searches will return all occurrences of the named signal
- The names are consistent between i.MX 6 series products implementing the same modules
- The module instance is incorporated into the signal name

This change applies only to signal names. The original ball names have been preserved to prevent the need to change schematics, BSDL models, IBIS models, etc.

Throughout this document, the updated signal names are used except where referenced as a ball name (such as the Functional Contact Assignments table, Ball Map table, and so on). A master list of the signal name changes is in the document, *IMX 6 Series Signal Name Mapping* (EB792). This list can be used to map the signal names used in older documentation to the new standardized naming conventions.

6.2 13 x 13mm Package Information

6.2.1 Case 2240, 13 x 13 mm, 0.5 mm Pitch, 24 x 24 Ball Matrix

Figure 55 shows the top, bottom, and side views of the 13×13 mm BGA package.

Figure 55. 13 x 13, 0.5 mm BGA Package Top, Bottom, and Side Views

Table 71 shows the 13 x 13 mm BGA package details.

Table 71. 13 x 13, 0.5 mm BGA Package Details

Parameter	Symbol	Common Dimensions		
		Minimum	Normal	Maximum
Total Thickness	A	0.88	—	1.1
Stand Off	A1	0.16	—	0.26
Substrate Thickness	A2	0.26 REF		
Mold Thickness	A3	0.54 REF		
Body Size	D	13 BSC

¹ All balls marked Power Group NVCC33_IO or NVCC18_IO are dual-voltage I/Os. The user supplies NVCC33_IO and NVCC18_IO. In the IOMUX for each ball, the user selects either 3.3V or 1.8V operation using the LVE field in the Pad Control Register for each ball.

² The state immediately after reset and before ROM firmware or software has executed.

³ Variance of the pull-up and pull-down strengths are shown in the tables as follows:

- [Table 22, "DVGPI/O DC Parameters," on page 32.](#)
- [Table 23, "GPIO I/O DC Parameters," on page 33](#)
- [Table 24, "LPDDR2 I/O DC Electrical Parameters," on page 34](#)
- [Table 25, "DDR3 I/O DC Electrical Parameters," on page 34](#)

7 Revision History

Table 76 provides a history for revision 3 of this data sheet.

Table 76. i.MX 6SoloLite Data Sheet Document Revision History

Rev. Number	Date	Substantive Change(s)
Rev. 3.0	02/2014	• Section 1.2, Feature description for: - Camera sensors: Added to Parallel Camera port “and up to 66 MHz peak”. - Miscellaneous IPs and interfaces; Changed from: “Three I2S/SSI/AC97 supported,” to “SSI block is capable of supporting audio sample frequencies up to 192 kHz stereo inputs and outputs with I2S mode.” • Table 2, Modules List: UART1–5, Brief Description; Changed bullet about programmable baud rate to “up to 5 MHz.” • Table 2, Modules List: uSDHC1–4, Brief Description; Changed bullet about Fully compliant with SD command/response to include “and SDXC cards up to 2TB.” • Table 9, operating range for GPIO supplies: Added NVCC_1P2V min/typ/max values for LPDDR2, DDR3L, DDR3. • Section 4.1.4, External Clock Sources; added Note, “The internal oscillator may run high ...”. • Table 11, Maximum Supply currents: Added row; NVCC_LVDS2P5 • Section 4.2.1, Power-Up Sequence: reworded third bulleted item regarding POR control. • Section 4.2.1, Power-Up Sequence: removed Note. • Section 4.5.1, OSC24K, first paragraph corrected ‘powered from’ signal from NVCC_1P2 to NVCC_1P2V. • Section 4.5.2, OSC32K, Changed second paragraph and added CAUTION. • Table 34 Reset Timing Parameters, changed Unit from XTALI cycle to XTALOSC_RTC_XTALI cycle. • Section 4.5.2, External Interface Module; enhanced wording to first paragraph to describe operating frequency for data transfers, and to explain register settings are valid for entire range of frequencies. • Table 37, EIM Bus Timing Parameters; reworded footnotes for clarity. • Table 40, DDR3 Write Cycle; changed footnote 3, outputs from “DDR_VREF” to “DRAM_VREF”. • Figure 25, LPDDR2 Command and Address Timing Diagram; changed signal name from “DRAM_CAS_B” to “DRAM_ADDRxx”. • Table 42, LPDDR2 Timing Parameters; changed footnote 2, outputs from “DDR_VREF” to “DRAM_VREF”. • Table 43, LPDDR2 Write Cycle; changed footnote 3, outputs from “DDR_VREF” to “DRAM_VREF”. • Table 44, LPDDR2 Read Cycle; changed footnote 3, outputs from “DDR_VREF” to “DRAM_VREF”. • Table 72, 13x13mm Supplies Contact Assignment; changed Supply Rail Name “DDR_VREF” to “DRAM_VREF”. • Table 72, 13x13mm Supplies Contact Assignment; changed ZQPAD ball position from “AE17” to “H2”. • Table 74, 13x13mm Functional Contact Assignment; Changed the following signals to include active-low “_B” in the Default Function column: DRAM_CAS_B; DRAM_CS0_B; DRAM_CS1_B; DRAM_RAS_B; DRAM_RESET_B. • Table 74, 13x13mm Functional Contact Assignment; Changed the Ball Name of DRAM_WE_B to DRAM_SDWE. • Table 74, 13 x 13 mm, 0.5 mm Pitch Ball Map; Y19, changed from “ON/OFF” to “NVCC_PLL”. • Table 74, 13 x 13 mm, 0.5 mm Pitch Ball Map; W18, changed from “TEST_MODE” to “ON/OFF”. • Table 74, 13 x 13 mm, 0.5 mm Pitch Ball Map; U15, changed from “NVCC_PLL” to “TEST_MODE”. • Table 74, 13 x 13 mm, 0.5 mm Pitch Ball Map; U11 & U10, changed from “NHVCC_3V3” to “NVCC33_IO”.

Table 76. i.MX 6SoloLite Data Sheet Document Revision History (continued)

Rev. Number	Date	Substantive Change(s)
Rev. 2.2	8/2013	Substantive Changes are as follows: • Section 1.2, “Features,” corrected value of OCRM from 256KB to 128KB: The SoC-level memory system consists of the following additional components: — Boot ROM, including HAB (96 KB) — Internal multimedia / shared, fast access RAM (OCRAM, 128 KB) • Removed parenthetical statement (input slope ≤ 5 ns) from Table 34, “Reset Timing Parameters” CC1: Duration of POR_B to be qualified as valid. The parenthetical statement was a typographical error and is not a specification requirement for this device.
Rev. 2.1	05/2013	Substantive changes throughout this document are as follows: • Incorporated standardized signal names. This change is extensive throughout the document. • Added section Section 1.3, “Updated Signal Naming Convention”. • Added reference to EB792, i.MX Signal Name Mapping. • Figures updated to align to standardized signal names. • Updated references to eMMC standard to include 4.41. • References to Consumer and Extended consumer temperature grades changed to Commercial and Extended Commercial. • Figure 1 “Part Number Nomenclature—i.MX 6SoloLite,” updates to <i>Silicon Revision</i> section. • Table 1 “Orderable Part Numbers” part numbers updated and options updated accordingly. • Table 2 “i.MX 6SoloLite Modules List” Changed reference to Global Power Controller to read General Power Controller. • Table 12. “Stop Mode Current and Power Consumption” Added SNVS only mode information. • Table 47 “ECSPI Master Mode Timing Parameters,” updated CS5/CS6 Min to Half ECSPIx_SCLK period-4/Half ECSPIx_SCLK period-2. • Table 47 “ECSPI Master Mode Timing Parameters,” added to CS8 parameters slow group/fast group. • Table 49 “SD/eMMC4.3 Interface Timing Specification,” changed SD8 from 5.6ns to 1.5ns. • Table 73 “13 x 13 mm Functional Contact Assignments,” Changes throughout. NVCC_GPIO, NVCC_SD1, NVCC_SD2, NVCC_SD3, and NVCC_LCD entries in the Power Group column changed to NVCC33_IO or NVCC18_IO. • Table 73 “13 x 13 mm Functional Contact Assignments,” Added footnote to Value to include reference information to pull-up and pull-down strengths. • Table 73: “13 x 13 mm Functional Contact Assignments,” for contact ECSPI_MOSI through ECSPI2_SCLK changed ball type from ALT5 to GPIO. • Section 1.2, “Features,” added bulleted items regarding the SOC-level memory system. • Renamed and updated Section 4.3.2, “Regulators for Analog Modules.” • Section 4.10.5, “FEC AC Timing Parameters,” removed FEC MII subsections and other references to MII—changed to RMII as applicable. • Removed section, “EIM Signal Cross Reference.” Signal names are now aligned between Reference Manual and Data Sheet.
