

MAX2090

50MHz to 1000MHz Analog VGA with Threshold Alarm Circuit and Error Amplifier for Level Control

General Description

The MAX2090 high-linearity analog variable-gain amplifier (VGA) is a monolithic SiGe BiCMOS attenuator, amplifier, error amplifier, and alarm circuit, designed to interface with 50 Ω systems operating in the 50MHz to 1000MHz frequency range. An external analog control voltage controls the analog attenuator. The device features a gain range of -10.9dB to +26.1dB, a noise figure of 4dB, OIP3 linearity of +38dBm, and a wide RF bandwidth. Each of these features makes the device an ideal VGA for numerous receiver and transmitter applications. In addition, the device operates from a single +5.0V supply.

This device is available in a compact 20-pin TQFN package (5mm x 5mm) with an exposed pad. Electrical performance is guaranteed over the extended temperature range, from T_C = -40°C to +95°C.

Applications

Point-to-Point Receivers and Transmitters
RF/IF Variable-Gain Stages
Temperature-Compensation Circuits
Cellular Applications
WiMAX™ Applications
LTE Applications
Fixed Broadband Wireless Access
Wireless Local Loop
Military Systems

Benefits and Features

- ◆ **Wideband Coverage**
 - ✧ 50MHz to 1000MHz RF Frequency Range
- ◆ **High Linearity**
 - ✧ +38dBm OIP3 (100MHz)
 - ✧ +17.5dBm Output -1dB Compression Point (100MHz)
- ◆ **26.1dB Gain**
- ◆ **37dB Attenuator Range**
- ◆ **4dB Noise Figure (Includes Attenuator Insertion Loss)**
- ◆ **0.25dB Gain Variation Over 100MHz Bandwidth**
- ◆ **Analog Attenuator Controlled with External Voltage**
- ◆ **Alarm Circuit with Adjustable Threshold**
- ◆ **Extended +4.75V to +5.8V Supply Range**
- ◆ **Lead(Pb)-Free Package**
- ◆ **Power-Down Capabilities**

MAX2090

50MHz to 1000MHz Analog VGA with Threshold Alarm Circuit and Error Amplifier for Level Control

ABSOLUTE MAXIMUM RATINGS

V _{CC_A} , V _{CC_RF}	-0.3V to +6V	RF_OUT Output Power	+20dBm
RF_IN, RF_OUT	-0.3V to (V _{CC} + 0.3V)	Continuous Power Dissipation (Note 1)	2.5W
R_BIAS, ALM_THRES, PLVLSET, AMP_OUT	-0.3V to +3.6V	Operating Case Temperature Range (Note 2) ..	-40°C to +95°C
CTRL1, CTRL2	-0.3V to +3.6V	Maximum Junction Temperature.....	+150°C
ALM	-0.3V to +3.6V	Storage Temperature Range.....	-65°C to +150°C
DET_VIN	-0.3V to +3.6V	Lead Temperature (soldering, 10s)	+300°C
RF_IN Input Power	+15dBm	Soldering Temperature (reflow)	+260°C

Note 1: Based on junction temperature $T_J = T_C + (\theta_{JC} \times V_{CC} \times I_{CC})$. This formula can be used when the temperature of the exposed pad is known while the device is soldered down to a PCB. See the [Applications Information](#) section for details. The junction temperature must not exceed +150°C.

Note 2: T_C is the temperature on the exposed pad of the package. T_A is the ambient temperature of the device and PCB.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PACKAGE THERMAL CHARACTERISTICS

TQFN

Junction-to-Ambient Thermal Resistance θ_{JA} (Notes 3, 4) .. +29°C/W

Junction-to-Case Thermal Resistance θ_{JC} (Notes 1, 4) .. 7°C/W

Note 3: Junction temperature $T_J = T_A + (\theta_{JA} \times V_{CC} \times I_{CC})$. This formula can be used when the ambient temperature of the PCB is known. The junction temperature must not exceed +150°C.

Note 4: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

DC ELECTRICAL CHARACTERISTICS

([Typical Application Circuit](#), V_{CC} = 4.75V to 5.8V, V_{GND} = 0V, and T_C = -40°C to +95°C. Typical values are at V_{CC} = 5.5V, V_{PLVLSET} = 2.5V, and T_C = +25°C, unless otherwise noted.) (Note 5)

MAX2090

50MHz to 1000MHz Analog VGA with Threshold Alarm Circuit and Error Amplifier for Level Control

AC ELECTRICAL CHARACTERISTICS (continued)

([Typical Application Circuit](#) with analog attenuator set to minimum attenuation, $V_{CC} = 4.75V$ to $5.8V$, $f_{RF} = 350MHz$, $T_C = -40^{\circ}C$ to $+95^{\circ}C$, and RF ports are connected to 50Ω sources, unless otherwise noted. Typical values are at $T_C = +25^{\circ}C$, $V_{CC} = 5.5V$, $P_{RF_IN} = -25dBm$, $V_{PLVLSET} = 2.5V$, $CTRL1 = 1$, $CTRL2 = 0$. Min/max specifications apply over supply, process, and temperature, unless otherwise noted.) (Note 8)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Output Second-Order Intercept Point	OIP2	PRF_OUT = 0dBm/tone, $f_{RF2} - f_{RF1} = 1MHz$, $f_{RF_OUT} = f_{RF2} + f_{RF1}$		59.3		dBm
Output Second Harmonic		PRF_OUT = 0dBm		65.4		dBc
Output Third Harmonic		PRF_OUT = 0dBm		80.5		dBc
Output -1dB Compression Point	P1dB	(Note 9)	14	17.6		dBm
Average Gain-Control Slope		VPLVLSET = 0.5V to 2.0V (Note 6)	16.5	19.5	23.0	dB/V
Maximum Gain-Control Slope		VPLVLSET = 0 to 2.5V		25		dB/V
VGA Reverse Isolation				35		dB
Attenuator Response Time		PRF_IN = -15dBm, VPLVLSET = 2.5V to 1.2V, output settled within $\pm 0.5dB$ of final value		330		ns
		PRF_IN = -15dBm, VPLVLSET = 1.2V to 2.5V, output settled within $\pm 0.5dB$ final value		220		
Insertion Phase Change		VPLVLSET = 2.5V to 0V		11		Degrees
RF_IN Return Loss		$Z_S = 50\Omega$, over full attenuation range (Note 6)	13.5	20		dB
RF_OUT Return Loss		$Z_L = 50\Omega$ over full attenuation range (Note 6)	13.5	20		dB
ERROR AMPLIFIER AND ALARM CIRCUIT (CTRL1 = CTRL2 = 1)						
Maximum AMP_OUT Capacitance to GND		(Note 7)			20	pF
ALM Threshold		ALM_THRES open (Input = DET_VIN)		1.35		V

Note 5: Production tested and guaranteed at $T_C = +95^{\circ}C$ for worst-case supply voltage. Performance at $T_C = +25^{\circ}C$ and $T_C = -40^{\circ}C$ are guaranteed by design and characterization for worst-case supply voltage.

Note 6: Guaranteed by design and characterization.

Note 7: Recommended functional range. Not production tested. Operation outside this range is possible, but with degraded performance of some parameters.

Note 8: All limits include external component losses. Output measurements were taken at the RF_OUT port.

Note 9: It is advisable not to continuously operate the RF_IN input power above 11dBm, and RF_OUT power above 19dBm.

Functional Block Diagram

MAX2090

50MHz to 1000MHz Analog VGA with Threshold Alarm Circuit and Error Amplifier for Level Control

Pin Configuration

Pin Description

PIN	NAME	FUNCTION
1	R_BIAS	Bias Resistor Setting Input. Connect a resistor from this pin to ground.
2	PLVLSET	AGC Loop Threshold-Level Input/Attenuator Control
3	CTRL2	Functional Control Bit (see Table 1)
4	VCC_A	Power-Supply Input. Bypass to ground with a 10nF capacitor as close as possible to the pin.
5	RF_IN	Attenuator Input (50Ω). Requires a DC-blocking capacitor.
6	AMP_OUT	Error Amplifier Output
8	DET_VIN	Error Amplifier Input Voltage from an External Detector
7, 9, 10, 11, 13, 14, 15, 18	GND	Ground
12	ALM	Alarm Logic Output
16	ALM_THRES	Alarm Threshold Voltage Input. See the <i>Alarm Operation</i> section for operation details.
17	CTRL1	Functional Control Bit (see Table 1)
19	RF_OUT	RF Output (50Ω). See the <i>Typical Application Circuit</i> for connection details.
20	VCC_RF	Driver Amplifier Supply Voltage Input. Bypass to ground with a 10nF capacitor as close as possible to the pin.
—	EP	Exposed Pad. Internally connected to ground. Connect to GND for proper RF performance and enhanced thermal dissipation.

MAX2090

50MHz to 1000MHz Analog VGA with Threshold Alarm Circuit and Error Amplifier for Level Control

Detailed Description

The MAX2090 is a high-linearity analog VGA designed to interface with 50 Ω systems operating in the 50MHz to 1000MHz frequency range. An external analog control voltage controls the analog attenuator. The device features a gain range of -10.9dB to +26.1dB, a noise figure of 4dB, OIP3 linearity of +38dBm, and a wide RF bandwidth. Each of these features makes the device an ideal VGA for numerous receiver and transmitter applications. In addition, the device operates from a single +5.0V supply.

Applications Information

Modes of Operation

The device can operate in several different modes, as summarized in [Table 1](#).

VGA-Only Mode Operation

VGA-only mode operation consists of setting CTRL1 = logic 1 and CTRL2 = logic 0, and applying a DC value to PLVLSET between 0 and 2.5V DC to manually adjust the attenuator and subsequently the RF_OUT power to any desired value. The output power at RF_OUT increases at a rate of 19.5dB/V as PLVLSET is increased. The error amplifier and alarm are powered off in this mode, reducing the supply current by 10mA typical. In VGA-only mode, components R5, R7, C8, C9, and C16 can be left unpopulated.

Closed-ALC Mode Operation

Closed-ALC mode operation consists of setting CTRL1 = CTRL2 = logic 1. In this mode, the DET_IN input is driven from an external detector through R7. Ideally, a power detector with an output voltage range of 0.1V to 2.4V DC is recommended, but the MAX2090 operates with any detector whose output ranges from 0 to 2.5V DC. PLVLSET is used to set the RF_OUT power by comparing it to the DET_VIN (pin 8) voltage in the error amplifier. As PLVLSET increases, the power at RF_OUT also increases. Components R5, C8, and C9 are installed to set the response time of the loop. See the *Typical Application Circuit*. This loop acts to maintain the input power to the external detector by driving the attenuator in servo fashion as the power level into RF_IN changes. PLVLSET can be externally driven to a DC value between 0 and 2.5V, such that the desired power is present at RF_OUT.

Control Inputs

The MAX2090 has four control inputs: CTRL1, CTRL2, ALM_THRES, and PLVLSET. V_{CC} must be present before voltages are applied to these pins. In cases where this is not possible, a 200 Ω resistor must be included in series with the control inputs to limit on-chip ESD diode conduction. CTRL1 and CTRL2 are 3V logic controls and cannot be driven from 5V logic. In the case where no logic control is available and a logic-high is required, a voltage-divider can be used from the 5V V_{CC} supply to produce the 3V logic-high.

Table 1. Mode Control Logic

CTRL1	CTRL2	VGA	ERROR AMPLIFIER	ALC LOOP	ALARM	FUNCTION DESCRIPTION
0	0	Disabled	Disabled	Disabled	Disabled	Power-down mode
1	1	Enabled	Enabled	Enabled	Enabled	Closed-ALC mode: ALC loop locks DET_VIN to PLVLSET
1	0	Enabled	Disabled	Disabled	Disabled	VGA-only mode
0	1	—	—	—	—	Factory test mode (do not use)

MAX2090

50MHz to 1000MHz Analog VGA with Threshold Alarm Circuit and Error Amplifier for Level Control

Alarm Operation

The alarm ALM output remains in a logic-high state while DET_VIN is above the 1.35V nominal. ALM_THRES has 135k Ω input resistance and is set internally to 1.35V (typ) such that ALM triggers when DET_VIN is below 1.35V. Alternatively, the voltage on ALM_THRES can be externally driven to allow alternative power-level trip points. When DET_IN is used to drive the DET_VIN pin through R7, the nominal value for ALM logic-high is typically above 1.22V at DET_IN. The ALM comparator has typical hysteresis of 29mV.

Layout Considerations

The pin configuration of the MAX2090 is optimized to facilitate a very compact physical layout of the device and its associated discrete components. The exposed pad (EP) of the device's 20-pin TQFN-EP package provides a low thermal-resistance path to the die. It is important that the PCB on which the device is mounted be designed to conduct heat from the EP. In addition, provide the EP with a low inductance path to electrical ground. The EP **MUST** be soldered to a ground plane on the PCB, either directly or through an array of plated via holes.

Table 2. Typical Application Circuit Component Values

COMPONENT	MODE OF OPERATION		VALUE	SIZE	SUPPLIER	DESCRIPTION
	VGA ONLY	CLOSED ALC				
C1, C5	√	√	1000pF	0402	Murata	C0G dielectric
C2, C3	√	√	0.01 μ F	0402	Murata	X7R dielectric
C8	—	√	100nF	0603	Murata	X7R dielectric
C9	—	√	820pF	0402	Murata	C0G dielectric
C14*	—		Do not install	0402	—	—
C16	—	√	0.01 μ F	0402	Murata	X7R dielectric
L1	√	√	330nH	0603	Coilcraft	Ferrite LS series 5% tolerance
R1	√	√	1.78k Ω	0402	Panasonic	1% tolerance
R5	—	√	150 Ω	0402	Panasonic	1% tolerance
R7	—	√	24k Ω	0402	Panasonic	5% tolerance
R11*	√	√	0 Ω	0402	Panasonic	1% tolerance
U1	√	√	—	20-pin TQFN (5mm x 5mm)	Maxim	MAX2090ETP+

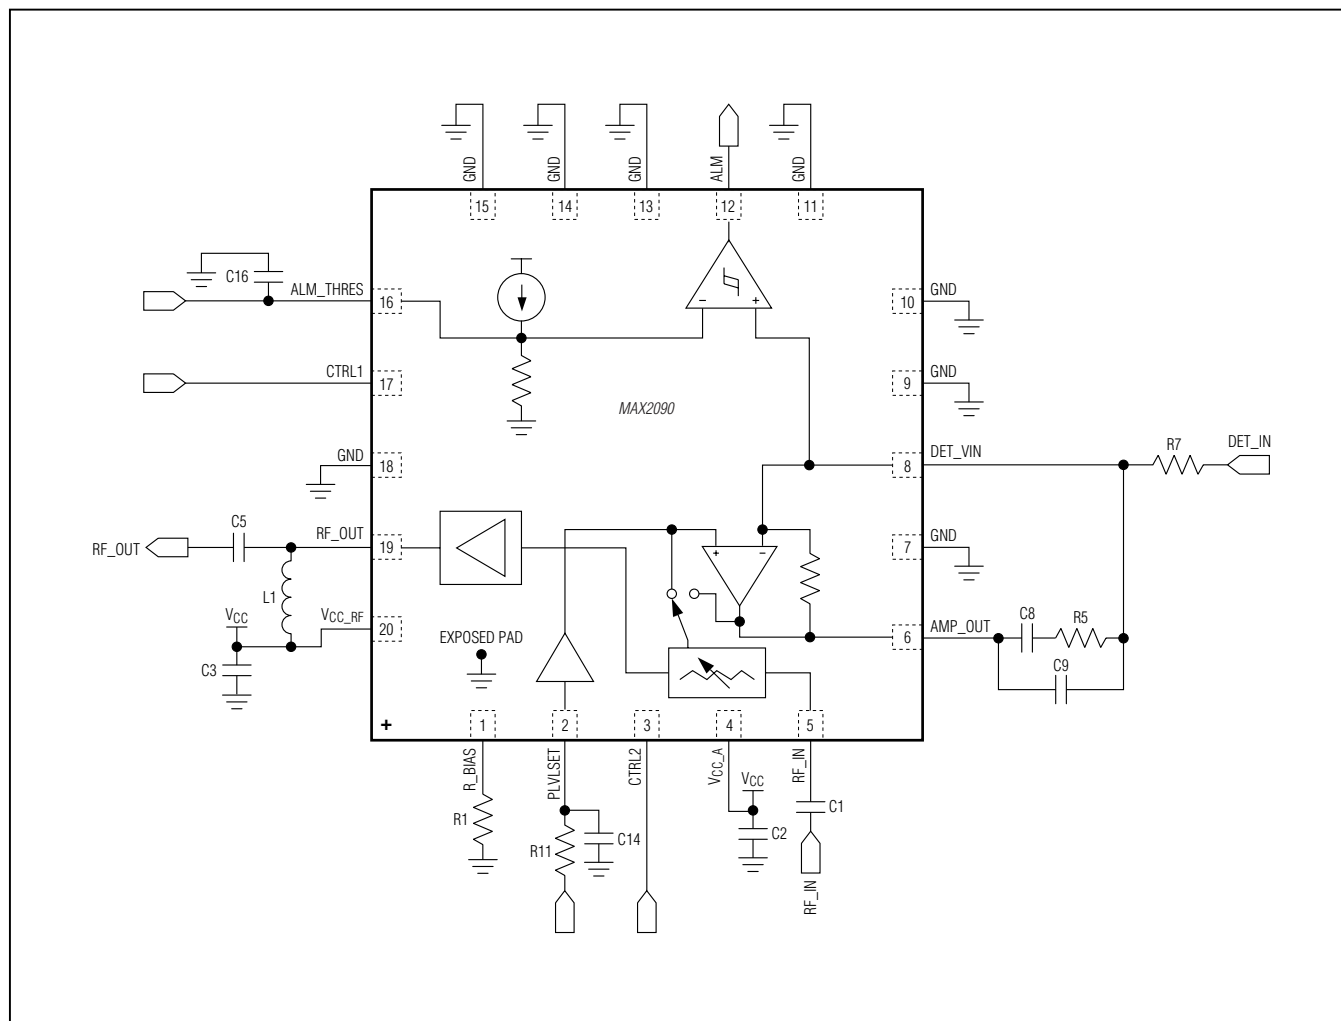

Note: The checkmarks in the Mode of Operation columns indicate that the component is used within each respective application.

*C14 and R11 form an optional lowpass network to filter out potential noise from the external PLVLSET control source.
