NCP339

3 A Ultra-Small Controlled Load Switch with Auto-Discharge Path and Reverse Current Control

The NCP339 is a very low Ron MOSFET controlled by external logic pin, allowing optimization of battery life, and portable device autonomy.

Indeed, due to a current consumption optimization with PMOS structure, leakage currents are eliminated by isolating connected IC on the battery when not used.

Reverse blocking control is automatically engage if OUT pin voltage is higher than IN pin voltage, eliminate leakages current from OUT to IN.

Proposed in a wide input voltage range from 1.2 V to 5.5 V, in a small 1 x 1.5 mm WLCSP6, pitch 0.5 mm.

Features

- 1.2 V – 5.5 V Operating Range
- 19 mΩ P MOSFET at 4.5 V
- DC Current up to 3 A
- Soft Start Control
- Low Quiescent Current
- Reverse Blocking
- Active High EN pin
- WLCSP6 1 x 1.5 mm
- This is a Pb−Free Device

Typical Applications

- Mobile Phones
- Tablets
- Digital Cameras
- GPS
- Portable Devices
- Computers

FUNCTIONAL DESCRIPTION

Overview

The NCP339 is a high side P channel MOSFET power distribution switch designed to isolate ICs connected on the battery in order to save energy. The part can be turned on, with a wide range of battery from 1.2 V to 5.5 V. Reverse blocking from output to input control is embedded in the IC to eliminate leakage current if Vout voltage exceed front end power supply.

Enable Input

Enable pin is an active high. The path is opened when EN pin is tied low (disable), forcing P MOS switch off.

The IN/OUT path is activated with a minimum of Vin of 1.2 V and EN forced to high level.

Blocking Control

The reverse blocking feature allows to avoid reverse current, through the PMOS fet if a voltage is applied on Vout pin, and V_{rev_thr} above the Vin pin. This function is available, whatever the EN logic pin state (High or low). To retrieve normal state, Vin-Vout must be higher to hysteresis of the reverse blocking comparator (V_{rev_hyst}). The reverse blocking comparator response time is set to T_{rev}.

Table 5. CONTROL LOGIC

V_{IN}	V_{OUT}	EN
Present	Mos OFF	Low
Present	Mos ON	High
Mos OFF	$V_{OUT} > V_{IN}$	x

Auto Discharge (Optional)

NMOS FET is placed between the output pin and GND, in order to discharge the application capacitor connected on OUT pin.

The auto-discharge is activated when EN pin is set to low level (disable state).

The discharge path (Pull down NMOS) stays activated as long as EN pin is set at low level and Vin > 1.2 V.

In order to limit the current across the internal discharge Nmosfet, the typical value is set at 70 Ω.

Cin and Cout Capacitors

Cin 1 μF and Cout 100 nF , at least, capacitors must be placed as close as possible the part to for stability improvement.

For inrush effects at start up, it's recommended to respect Cin > Cout size.

APPLICATION INFORMATION

Power Dissipation

Main contributor in term of junction temperature is the power dissipation of the power MOSFET. Assuming this, the power dissipation and the junction temperature in normal mode can be calculated with the following equations:

- $P_D = R_{DS(on)} \times (I_{OUT})^2$

  P_D = Power dissipation (W)
  $R_{DS(on)}$ = Power MOSFET on resistance (Ω)
  I_{OUT} = Output current (A)

- $T_J = P_D \times R_{\theta JA} + T_A$

  T_J = Junction temperature (°C)
  $R_{\theta JA}$ = Package thermal resistance (°C/W)
  T_A = Ambient temperature (°C)

PCB Recommendations

The NCP339 integrates an up to 3 A rated PMOS FET, and the PCB design rules must be respected to properly

evacuate the heat out of the silicon. By increasing PCB area, especially around IN and OUT pins, the $R_{\theta JA}$ of the package can be decreased, allowing higher power dissipation.

Routing example: 2 oz, 4 layers with vias across 2 internal inners.

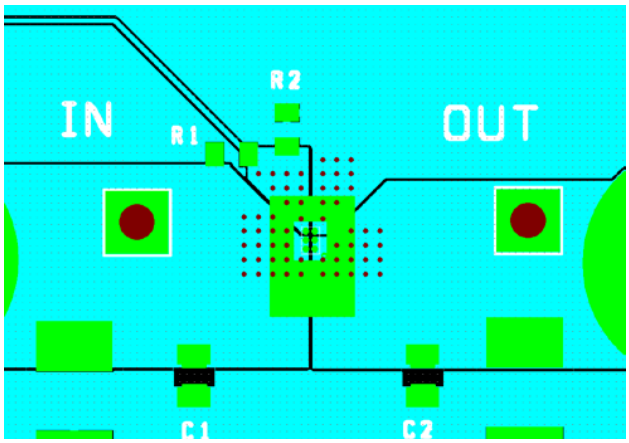

Figure 9.

Example of application definition.

$T_J - T_A = R_{\theta JA} \times P_D = R_{\theta JA} \times R_{DSON} \times I^2$

T_J: junction temperature.
T_A: ambient temperature.
R_θ = Thermal resistance between IC and air, through PCB.
R_{DSON}: intrinsic resistance of the IC Mosfet.
I: load DC current.

Taking into account of R_θ obtain with:

- 1 oz, 2 layers: 100°C/W.

  At 3 A, 25°C ambient temperature, R_{DSON} 20 mΩ @ Vin 5 V, the junction temperature will be:

  $T_J = T_A + R_\theta \times P_D = 25 + (0.02 \times 3^2) \times 100 = 43°C$

Taking into account of R_θ obtain with:

- 2 oz, 4 layers: 60°C/W.

  At 3 A, 65°C ambient temperature, R_{DSON} 24 mΩ @ Vin 5 V, the junction temperature will be:

  $T_J = T_A + R_\theta \times P_D = 65 + (0.024 \times 3^2) \times 60 = 78°C$
