

High-side driver with MultiSense analog feedback for automotive application

Datasheet - production data

- Loss of ground and loss of V_{CC}
- Configurable latch-off on overtemperature or power limitation with dedicated fault reset pin
- Reverse battery with external components
- Electrostatic discharge protection

Features

Max transient supply voltage	V_{CC}	40 V
Operating voltage range	V_{CC}	4 to 28 V
Typ. on-state resistance	R_{ON}	20 m Ω
Current limitation (typ)	I_{LIMH}	63 A
Stand-by current (max)	I_{STBY}	0.5 μ A

- General
 - Automotive qualified
 - Single channel smart high-side driver with MultiSense analog feedback
 - Very low standby current
 - Compatible with 3 V and 5 V CMOS outputs
- MultiSense diagnostic functions
 - Multiplexed analog feedback of: load current with high precision proportional current mirror, V_{CC} supply voltage and T_{CHIP} device temperature
 - Overload and short to ground (power limitation) indication
 - Thermal shutdown indication
 - OFF-state open-load detection
 - Output short to V_{CC} detection
 - Sense enable/disable
- Protections
 - Undervoltage shutdown
 - Overvoltage clamp
 - Load current limitation
 - Self limiting of fast thermal transients

Applications

- All types of automotive resistive, inductive and capacitive loads
- Specially intended for Automotive Turn Indicators (up to 2 x P27W or SAE1156 and R5W paralleled or LED Rear Combinations)

Description

The VN7020AJ-E is a single channel high-side driver manufactured using ST proprietary VIPower® technology and housed in PowerSSO-16 package. The device is designed to drive 12 V automotive grounded loads through a 3 V and 5 V CMOS-compatible interface, and to provide protection and diagnostics.

The device integrates advanced protective functions such as load current limitation, overload active management by power limitation and overtemperature shutdown with configurable latch-off. A $\overline{\text{FaultRST}}$ pin unlatches the output in case of fault or disables the latch-off functionality.

A dedicated multifunction multiplexed analog output pin delivers sophisticated diagnostic functions including high precision proportional load current sense, supply voltage feedback and chip temperature sense, in addition to the detection of overload and short circuit to ground, short to V_{CC} and OFF-state open-load.

A sense enable pin allows OFF-state diagnosis to be disabled during the module low-power mode as well as external sense resistor sharing among similar devices.

Table 1. Pin functions

Name	Function
V _{CC}	Battery connection.
OUTPUT	Power output.
GND	Ground connection. Must be reverse battery protected by an external diode / resistor network.
INPUT	Voltage controlled input pin with hysteresis, CMOS compatible. It controls output switch state.
MultiSense	Multiplexed analog sense output pin; it delivers a current proportional to the selected diagnostic: load current, supply voltage or chip temperature.
SEn	Active high compatible with 3 V and 5 V CMOS output pin; it enables the MultiSense diagnostic pin.
SEL _{0,1}	Active high compatible with 3 V and 5 V CMOS output pin; they address the MultiSense multiplexer.
FaultRST	Active low compatible with 3 V and 5 V CMOS output pin; it unlatches the output in case of fault; If kept low, sets the outputs in auto-restart mode.

2.1 Absolute maximum ratings

Stressing the device above the rating listed in [Table 3](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to the conditions in table below for extended periods may affect device reliability.

3 Protections

3.1 Power limitation

The basic working principle of this protection consists of an indirect measurement of the junction temperature swing ΔT_j through the direct measurement of the spatial temperature gradient on the device surface in order to automatically shut off the output MOSFET as soon as ΔT_j exceeds the safety level of ΔT_{j_SD} . According to the voltage level on the FaultRST pin, the output MOSFET switches on and cycles with a thermal hysteresis according to the maximum instantaneous power which can be handled (FaultRST = Low) or remains off (FaultRST = High). The protection prevents fast thermal transient effects and, consequently, reduces thermo-mechanical fatigue.

3.2 Thermal shutdown

In case the junction temperature of the device exceeds the maximum allowed threshold (typically 175°C), it automatically switches off and the diagnostic indication is triggered. According to the voltage level on the FaultRST pin, the device switches on again as soon as its junction temperature drops to T_R (see [Table 8](#), FaultRST = Low) or remains off (FaultRST = High).

3.3 Current limitation

The device is equipped with an output current limiter in order to protect the silicon as well as the other components of the system (e.g. bonding wires, wiring harness, connectors, loads, etc.) from excessive current flow. Consequently, in case of short circuit, overload or during load power-up, the output current is clamped to a safety level, I_{LIMH} , by operating the output power MOSFET in the active region.

3.4 Negative voltage clamp

In case the device drives inductive load, the output voltage reaches negative value during turn off. A negative voltage clamp structure limits the maximum negative voltage to a certain value, V_{DEMAG} (see [Table 8](#)), allowing the inductor energy to be dissipated without damaging the device.

4 Application information

Figure 35. Application diagram

4.1 GND protection network against reverse battery

Figure 36. Simplified internal structure

4.1.1 Diode (D_{GND}) in the ground line

A resistor (typ. $R_{GND} = 4.7 \text{ k}\Omega$) should be inserted in parallel to D_{GND} if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network produces a shift ($\approx 600 \text{ mV}$) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift does not vary if more than one HSD shares the same diode/resistor network.

4.2 Immunity against transient electrical disturbances

The immunity of the device against transient electrical emissions, conducted along the supply lines and injected into the V_{CC} pin, is tested in accordance with ISO 7637-2:2011 (E) and ISO 16750-2:2010.

The related function performance status classification is shown in [Table 12](#).

Test pulses are applied directly to DUT (Device Under Test) both in ON and OFF-state and in accordance to ISO 7637-2:2011(E), chapter 4. The DUT is intended as the present device only, without components and accessed through V_{CC} and GND terminals.

Status II is defined in ISO 7637-1 Function Performance Status Classification (FPSC) as follows: "The function does not perform as designed during the test but returns automatically to normal operation after the test".

Table 12. ISO 7637-2 - electrical transient conduction along supply line

Test Pulse 2011(E)	Test pulse severity level with Status II functional performance status		Minimum number of pulses or test time	Burst cycle / pulse repetition time		Pulse duration and pulse generator internal impedance

1	III	-112V	500 pulses	0,5 s		2ms, 10 Ω
2a	III	+55V	500 pulses	0,2 s	5 s	50 μ s, 2 Ω
3a	IV	-220V	1h	90 ms	100 ms	0.1 μ s, 50 Ω
3b	IV	+150V	1h	90 ms	100 ms	0.1 μ s, 50 Ω

Load dump according to ISO 16750-2:2010						
Test B ⁽³⁾		40V	5 pulse	1 min		400ms, 2 Ω

1. U_S is the peak amplitude as defined for each test pulse in ISO 7637-2:2011(E), chapter 5.6.

2. Test pulse from ISO 7637-2:2004(E).

3. With 40 V external suppressor referred to ground ($-40^\circ\text{C} < T_j < 150^\circ\text{C}$).

4.3 MCU I/Os protection

If a ground protection network is used and negative transients are present on the V_{CC} line, the control pins will be pulled negative. ST suggests to insert a resistor (R_{prot}) in line both to prevent the microcontroller I/O pins to latch-up and to protect the HSD inputs.

The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of microcontroller I/Os.

Equation 1

$$V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For $V_{CCpeak} = -150\text{ V}$; $I_{latchup} \geq 20\text{mA}$; $V_{OH\mu C} \geq 4.5\text{V}$

$$7.5\text{ k}\Omega \leq R_{prot} \leq 140\text{ k}\Omega.$$

Recommended values: $R_{prot} = 15\text{ k}\Omega$

4.4 Multisense - analog current sense

Diagnostic information on device and load status are provided by an analog output pin (Multisense) delivering the following signals:

- Current monitor: current mirror of channel output current
- V_{CC} monitor: voltage propotional to V_{CC}
- T_{CASE} : voltage propotional to chip temperature

Those signals are routed through an analog multiplexer which is configured and controlled by means of SELx and SEn pins, according to the address map in [Table 11](#).

Figure 37. Multisense and diagnostic – block diagram

4.4.1 Principle of Multisense signal generation

Figure 38. Multisense block diagram

Current monitor

When current mode is selected in the Multisense, this output is capable to provide:

- **Current mirror proportional to the load current in normal operation**, delivering current proportional to the load according to known ratio named **K**
- **Diagnostics flag in fault conditions** delivering fixed voltage V_{SENSEH}

The current delivered by the current sense circuit, I_{SENSE} , can be easily converted to a voltage V_{SENSE} by using an external sense resistor, R_{SENSE} , allowing continuous load monitoring and abnormal condition detection.

Normal operation (channel ON, no fault, SEn active)

While device is operating in normal conditions (no fault intervention), V_{SENSE} calculation can be done using simple equations

Current provided by Multisense output: $I_{SENSE} = I_{OUT}/K$

Where :

- V_{SENSE} is voltage measurable on R_{SENSE} resistor
- I_{SENSE} is current provided from Multisense pin in current output mode
- I_{OUT} is current flowing through output
- K factor represent the ratio between PowerMOS cells and SenseMOS cells; its spread includes geometric factor spread, current sense amplifier offset and process parameters spread of overall circuitry specifying ratio between I_{OUT} and I_{SENSE} .

In case of power limitation/overtemperature, the fault is indicated by the Multisense pin which is switched to a “current limited” voltage source, V_{SENSEH} (see [Table 9](#)).

In any case, the current sourced by the Multisense in this condition is limited to I_{SENSEH} (see [Table 9](#)).

The typical behavior in case of overload or hard short circuit is shown in [Figure 10](#), [Figure 11](#) and [Figure 12](#).

The schematic diagram illustrates the internal architecture of the GAPCGT00633 open load detection IC. The IC is powered by V_{bat} and V_{cc} , with a $100\text{nF}/50\text{V}$ capacitor connected to V_{cc} . The output is connected to an external pull-up switch and a $10\text{nF}/100\text{V}$ capacitor. The internal circuitry includes a Logic block, a Current mirror, and various input/output pins. The input pins are connected to a Microcontroller via $15\text{k}\Omega$ resistors. The output pin is connected to the Microcontroller via a $15\text{k}\Omega$ resistor. 4.4.2 T_{CASE} and V_{CC} monitor

In this case, MultiSense output operates in voltage mode and output level is referred to device GND. Care must be taken in case a GND network protection is used, because of a voltage shift is generated between device GND and the microcontroller input GND reference.

Figure 41 shows link between $V_{MEASURED}$ and real V_{SENSE} signal.

Figure 41. GND voltage shift

V_{CC} monitor

Battery monitoring channel provides $V_{SENSE} = V_{CC} / 4$.

Case temperature monitor

Case temperature monitor is capable to provide information about actual device temperature. Since diode is used for temperature sensing, following equation describe link between temperature and output V_{SENSE} level:

$$V_{SENSE_TC}(T) = V_{SENSE_TC}(T_0) + dV_{SENSE_TC} / dT * (T - T_0)$$

where dV_{SENSE_TC} / dT ~ typically -5.5 mV/K (for temperature range (-40°C to +150°C)).

4.4.3 Short to V_{CC} and OFF-state open-load detection

Short to V_{CC}

A short circuit between V_{CC} and output is indicated by the relevant current sense pin set to V_{SENSEH} during the device off-state. Small or no current is delivered by the current sense during the on-state depending on the nature of the short circuit.

OFF-state open-load with external circuitry

Detection of an open-load in off mode requires an external pull-up resistor R_{PU} connecting the output to a positive supply voltage V_{PU} .

It is preferable V_{PU} to be switched off during the module standby mode in order to avoid the overall standby current consumption to increase in normal conditions, i.e. when load is connected.

R_{PU} must be selected in order to ensure $V_{OUT} > V_{OLmax}$ in accordance with to following equation:

Equation 2

$$R_{PU} < \frac{V_{PU} - 4}{I_{L(off2)min} @ 4V}$$

4.5 Maximum demagnetization energy ($V_{CC} = 16\text{ V}$)

Figure 42. Maximum turn off current versus inductance

Note:

Values are generated with $R_L = 0\ \Omega$.

In case of repetitive pulses, T_{jstart} (at the beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.

6 Package information

6.1 ECOPACK®

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com.

ECOPACK® is an ST trademark.

8 Revision history

Table 18. Document revision history

Date	Revision	Changes
25-Oct-2011	1	Initial release
03-Apr-2012	2	Updated Features list Updated Table 2: Suggested connections for unused and not connected pins Updated Figure 2: Configuration diagram (top view) Table 3: Absolute maximum ratings: – V_{CCPK}, I_{SENSE}, E_{MAX}: updated value – V_{CCJS}: added row – $-V_{SENSE}$: removed row Table 5: Power section: – $V_{USDReset}$, $I_{GND(ON)}$: added row – t_{D_STBY}, V_F: updated values Updated following tables: – Table 6: Switching ($V_{CC} = 13\text{ V}$; $-40^{\circ}\text{C} < T_j < 150^{\circ}\text{C}$, unless otherwise specified) – Table 7: Logic inputs ($7\text{ V} < V_{CC} < 28\text{ V}$; $-40^{\circ}\text{C} < T_j < 150^{\circ}\text{C}$) – Table 8: Protections ($7\text{ V} < V_{CC} < 18\text{ V}$; $-40^{\circ}\text{C} < T_j < 150^{\circ}\text{C}$) Added Figure 9: TDSTKON Updated Section 2.4: Waveforms Added following chapters: – Chapter 3: Protections – Chapter 4: Application information Updated Section 5.1: PowerSSO-16 thermal data

Table 18. Document revision history (continued)

Date	Revision	Changes
02-Jul-2012	3	Table 3: Absolute maximum ratings: – I_{SENSE}: updated parameter – V_{ESD}: updated values Updated Table 4: Thermal data Table 5: Power section – V_{clamp}: added test condition – $I_{GND(ON)}$: updated test condition Table 8: Protections ($7\text{ V} < V_{CC} < 18\text{ V}$; $-40^{\circ}\text{C} < T_j < 150^{\circ}\text{C}$): – I_{LIMH}, T_R: added note – V_{ON}, V_{DEMAG}: updated test condition Table 9: MultiSense ($7\text{ V} < V_{CC} < 18\text{ V}$; $-40^{\circ}\text{C} < T_j < 150^{\circ}\text{C}$): – K_{OL}, dK_{cal}/K_{cal}, K_{LED}, dK_{LED}/K_{LED}, K_0, dK_0/K_0, K_1, dK_1/K_1, K_2, dK_2/K_2, K_3, dK_3/K_3: updated test condition – $I_{L(off2)}$, V_{SENSE_TC}, V_{SENSE_VCC}, I_{SENSEH}, I_{SENSE0}, V_{SENSE_SAT}, I_{SENSE_SAT}: updated values – I_{OUT_SAT}: added row Updated Figure 6: Switching times and Pulse skew Removed figure Pulse skew Table 11: MultiSense multiplexer addressing: added note Updated Table 16: PowerSSO-16 mechanical data

Table 18. Document revision history (continued)

Date	Revision	Changes
04-Apr-2013	4	Updated Table 2: Suggested connections for unused and not connected pins Table 3: Absolute maximum ratings: – V_{CCPK}, E_{MAX}: updated parameter – $-I_{OUT}$, I_{SENSE}: updated values Table 4: Thermal data: – R_{thj_board}, R_{thj_amb}: updated values Table 5: Power section: – $I_{GND(ON)}$: updated maximum value – V_F: updated test conditions Table 6: Switching ($V_{CC} = 13\text{ V}$; $-40^{\circ}\text{C} < T_j < 150^{\circ}\text{C}$, unless otherwise specified): – W_{ON}, W_{OFF}: updated values Table 9: MultiSense ($7\text{ V} < V_{CC} < 18\text{ V}$; $-40^{\circ}\text{C} < T_j < 150^{\circ}\text{C}$): – V_{SENSE_CL}, V_{SENSE_TC}: updated test conditions and value – K_{LED}, K_0, K_1, K_2, K_3, V_{SENSEH}: updated values – V_{SENSE_VCC}: updated test conditions Table 11: MultiSense multiplexer addressing: – Negative output: updated values Removed Table: Electrical transient requirements (part 1), Table: Electrical transient requirements (part 2) and Table: Electrical transient requirements (part 3) Updated Section 3.2: Thermal shutdown and Section 3.4: Negative voltage clamp Removed Section: Load dump protection Added Section 4.2: Immunity against transient electrical disturbances Updated Section 4.1.1: Diode (DGND) in the ground line Updated Table 41: GND voltage shift Updated Table 14: PCB properties
03-Sep-2013	5	Updated Features list Table 6: Switching ($V_{CC} = 13\text{ V}$; $-40^{\circ}\text{C} < T_j < 150^{\circ}\text{C}$, unless otherwise specified): – dV_{OUT}/dt_{on}, dV_{OUT}/dt_{off}, W_{ON}, W_{OFF}: updated values Table 9: MultiSense ($7\text{ V} < V_{CC} < 18\text{ V}$; $-40^{\circ}\text{C} < T_j < 150^{\circ}\text{C}$): – K_{OL}, K_{LED}, K_0, K_1, K_2, K_3: updated values Added Figure 4: IOUT/ISENSE versus IOUT and Figure 5: Current sense accuracy versus IOUT Added Section 2.5: Electrical characteristics curves Updated Section 3.1: Power limitation Updated Section 6.2: PowerSSO-16 package information
19-Sep-2013	6	Updated disclaimer.
09-Jun-2014	7	Updated Section 6.2: PowerSSO-16 package information
29-Sep-2014	8	Updated Chapter 5: Package and PCB thermal data Updated Table 16: PowerSSO-16 mechanical data
21-Oct-2014	9	Updated Table 16: PowerSSO-16 mechanical data
