
15mm x 16mm x 5.8mm

20A SIMPLE SWITCHER® Power Module with 3.0V-14.5V Input in QFN Package

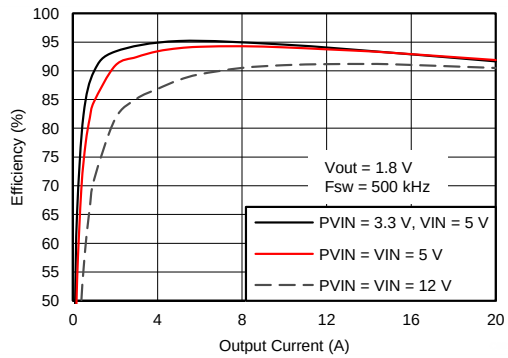
Check for Samples: LMZ31520

FEATURES

- **Complete Integrated Power Solution; Smaller than a Discrete Design**
- **15 mm × 16 mm × 5.8 mm Package Size - Pin Compatible with LMZ31530**
- **Ultra-Fast Load Step Response**
- **Efficiencies Up To 96%**
- **Wide-Output Voltage Adjust 0.6 V to 3.6 V, with 1% Reference Accuracy**
- **Optional Split Power Rails Allows Input Voltage Down to 3.0 V**
- **Selectable Switching Frequency (300 kHz to 850 kHz)**
- **Selectable Slow-Start**
- **Adjustable Overcurrent Limit**
- **Power Good Output**
- **Output Voltage Sequencing**
- **Over Temperature Protection**
- **Pre-bias Output Start-up**
- **Operating Temperature Range: –40°C to 85°C**
- **Enhanced Thermal Performance: 8.6°C/W**
- **Meets EN55022 Class A Emissions - Integrated Shielded Inductor**

APPLICATIONS

- **Broadband and Communications Infrastructure**
- **DSP and FPGA Point of Load Applications**
- **High Density Power Systems**

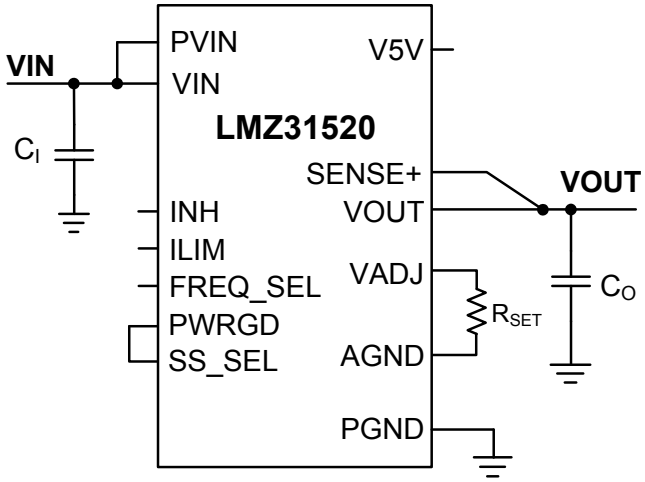


DESCRIPTION

The LMZ31520 SIMPLE SWITCHER® power module is an easy-to-use integrated power solution that combines a 20-A DC/DC converter with power MOSFETs, a shielded inductor, and passives into a low profile, QFN package. This total power solution allows as few as three external components and eliminates the loop compensation and magnetics part selection process.

The 15x16x5.8 mm QFN package is easy to solder onto a printed circuit board and allows a compact point-of-load design. Achieves greater than 95% efficiency, has ultra-fast load step response and excellent power dissipation capability with a thermal impedance of 8.6°C/W. The LMZ31520 offers the flexibility and the feature-set of a discrete point-of-load design and is ideal for powering a wide range of ICs and systems. Advanced packaging technology affords a robust and reliable power solution compatible with standard QFN mounting and testing techniques.

SIMPLIFIED APPLICATION



This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ABSOLUTE MAXIMUM RATINGS(1)

over operating temperature range (unless otherwise noted)		VALUE		UNIT
		MIN	MAX	
Input Voltage	VIN, PVIN	–0.3	20	V
	INH, VADJ, PWRGD, PWRGD_PU, ILIM, FREQ_SEL, SS_SEL, V5V	–0.3	7	V
Output Voltage	PH	–1	25	V
	PH 10ns Transient	–2	27	
	VOUT	–0.3	6	V
V_{DIFF} (GND to exposed thermal pad)			±200	mV
Operating Junction Temperature		–40	125(2)	°C
Storage Temperature		–55	150	°C
Mechanical Shock	Mil-STD-883D, Method 2002.3, 1 msec, 1/2 sine, mounted		250	G
Mechanical Vibration	Mil-STD-883D, Method 2007.2, 20-2000Hz		20	

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) See the temperature derating curves in the Typical Characteristics section for thermal information.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)		MIN	MAX	UNIT
PV_{IN}	Input Switching Voltage	3.0	14.5	V
V_{IN}	Input Bias Voltage	4.5	14.5	V
V_{OUT}	Output Voltage	0.6	3.6	V
f_{SW}	Switching Frequency	300	850	kHz

ORDERING INFORMATION

For the most current package and ordering information, see the Package Option Addendum at the end of this datasheet, or see the TI website at www.ti.com.

THERMAL INFORMATION

THERMAL METRIC(1)			LMZ31520 RLG 72 PINS	UNIT
θ_{JA}	Junction-to-ambient thermal resistance(2)	Natural Convection	8.6	°C/W
$\theta_{JA(100LFM)}$	Junction-to-ambient thermal resistance(3)	100 LFM	7.8	
ψ_{JT}	Junction-to-top characterization parameter(4)		1.6	
ψ_{JB}	Junction-to-board characterization parameter(5)		4.2	

(1) For more information about traditional and new thermal metrics, see the IC Package Thermal Metrics application report, SPRA953.
(2) The junction-to-ambient thermal resistance, θ_{JA}, applies to devices soldered directly to a 100 mm x 100 mm, 6-layer PCB with 1 oz. copper and natural convection cooling. Additional airflow reduces θ_{JA}.
(3) The junction-to-ambient thermal resistance, θ_{JA}, applies to devices soldered directly to a 100 mm x 100 mm, 6-layer PCB with 1 oz. copper and 100 LFM forced air cooling. Additional airflow reduces θ_{JA}.
(4) The junction-to-top characterization parameter, ψ_{JT}, estimates the junction temperature, T_J, of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7). $T_J = \psi_{JT} * Pdis + T_T$; where Pdis is the power dissipated in the device and T_T is the temperature of the top of the device.
(5) The junction-to-board characterization parameter, ψ_{JB}, estimates the junction temperature, T_J, of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7). $T_J = \psi_{JB} * Pdis + T_B$; where Pdis is the power dissipated in the device and T_B is the temperature of the board 1mm from the device.

PACKAGE SPECIFICATIONS

LMZ31520		UNIT
Weight		4.96 grams
Flammability	Meets UL 94 V-O	
MTBF Calculated reliability	Per Bellcore TR-332, 50% stress, T_A = 40°C, ground benign	26.5 MHrs

ELECTRICAL CHARACTERISTICS

T_A = -40°C to 85°C, VIN = 12 V, VOUT = 1.8 V, I_{OUT} = 20A
C_{IN} = 2x 22 µF ceramic & 330 µF bulk, C_{OUT} = 4x 100 µF ceramic (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
I_{OUT}	Output current			0		20	A

f_{SEL}	Frequency Select (4)	66 kΩ resistor between FREQ_SEL pin and PGND			300		kHz
		FREQ_SEL pin connected to V5V (pin 61)			850		kHz
	Thermal Shutdown	Thermal shutdown			145		°C
		Thermal shutdown hysteresis			10		°C
C_{IN}	External input capacitance		Ceramic	44 (5)	94		µF
			Non-ceramic		330		

(1) The minimum PVIN voltage is 3.0V or (V_{OUT}+ 1.1V), whichever is greater. See VIN and PVIN Input Voltage for more details.
(2) The stated limit of the set-point voltage tolerance includes the tolerance of both the internal voltage reference and the internal adjustment resistor. The overall output voltage tolerance will be affected by the tolerance of the external R_{SET} resistor.
(3) This pin has an internal pull-up to approximately 0.4 x V_{IN}. If this pin is left open circuit, the device operates when a valid input voltage is applied. A small, low-leakage (<300nA) MOSFET is recommended for control.
(4) See the Frequency Select section for more information on selecting the frequency.
(5) A minimum of 44 µF (2x 22 µF) of external ceramic capacitance is required across the input (PVIN/VIN and PGND connected) for proper operation. Locate the capacitor close to the device. See Table 3 for more details. When operating with split VIN and PVIN rails, place 4.7 µF of ceramic capacitance directly at the VIN pin to PGND.

ELECTRICAL CHARACTERISTICS (continued)

T_A = -40°C to 85°C, VIN = 12 V, VOUT = 1.8 V, I_{OUT} = 20A
C_{IN} = 2x 22 µF ceramic & 330 µF bulk, C_{OUT} = 4x 100 µF ceramic (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
C_{OUT}	External output capacitance		100 (6)	400	5000	µF

(6) A minimum of 100 µF of ceramic capacitance is required at the output. Locate the capacitance close to the device. Adding additional capacitance close to the load improves the response of the regulator to load transients and reduces ripple. See Table 3 for more details.

PIN DESCRIPTIONS

TERMINAL		DESCRIPTION
NAME	NO.	
AGND	9	This pin is connected internally to the power ground of the device. This pin should only be used as the zero volt ground reference for connecting the voltage setting resistor (R_{SET}). Do not connect AGND to PGND. See Layout Recommendations.
DNC	4	Do Not Connect. Do not connect these pins to AGND, to another DNC pin, or to any other voltage. These pins are connected to internal circuitry. Each pin must be soldered to an isolated pad.
	8	
	12	
	20	
	21	
	35	
	36	
FREQ_SEL	7	Frequency Select pin. Leave this pin open (floating) to select 500 kHz (typ) operating frequency. Connect this pin to V5V pin to select 850 kHz (typ) operating frequency. Connect a 66 kΩ resistor between this pin and PGND to select 300 kHz (typ) operating frequency. See Table 2 for more info.
ILIM	6	Current limit setting pin. Connecting a resistor between this pin and PGND sets the current limit. When left open, refer to the Electrical Characterization table for current limit value.
INH	16	Inhibit pin. Use an open drain or open collector logic device to ground this pin to control the INH function.
NC	29	Not Connected. These pins are internally isolated from any signal and all other pins. Each pin must be soldered to a pad on the PCB. These pins can be left isolated, connected to one another, or connected to any signal on the PCB.
	30	
	31	
	32	
	45	
PGND	1	This is the return current path for the power stage of the device. Connect these pins to the load and to the bypass capacitors associated with VIN and VOUT. Pads 65, 67, 70, and 72 should be connected to PCB ground planes using multiple vias for good thermal performance. Not all pins are connected together internally. All pins must be connected together externally with a copper plane or pour directly under the device.

	71	
PVIN	42	Input switching voltage pin. This pin supplies voltage to the power switches of the converter.
	43	
	44	
	66	
	69	
PWRGD	19	Power Good flag pin. This open drain output asserts low if the output voltage is more than approximately ±6% out of regulation.
PWRGD_PU	18	Power Good pull-up pin. This pin is connected to a 100kΩ resistor which is tied to the PWRGD pin internally. Connect this pin to V5V or to any voltage between 1.3V and 6.5V.
SENSE+	14	Remote sense connection. Connect this pin to VOUT at the load for improved regulation. This pin must be connected to VOUT at the load, or at the module pins.
SS_SEL	3	Slow-start select pin. Connect a resistor between this pin and PWRGD (or PGND) to select the slow-start time. See the SS_SEL section of the datasheet for slow-start times and corresponding resistor values. Connect the SS_SEL pin to PGND to select Auto-skip Eco-mode or to the PWRGD pin (pin 19) to select FCCM.
V5V	61	5V regulator pin. This regulator supplies the internal circuitry.
VADJ	13	Output voltage adjust pin. Connecting a resistor between this pin and AGND sets the output voltage.
VIN	2	Input bias voltage pins. Supplies the control circuitry of the power converter.
	15	
VOUT	10	Output voltage. These pins are connected to the internal output inductor. Connect these pins to the output load and connect external bypass capacitors between these pins and PGND.

APPLICATION INFORMATION

ADJUSTING THE OUTPUT VOLTAGE

The VADJ control sets the output voltage of the LMZ31520. The output voltage adjustment range is from 0.6V to 3.6V. The adjustment method requires the addition of R_{SET}, which sets the output voltage, and the connection of SENSE+ to VOUT. The R_{SET} resistor must be connected directly between the VADJ (pin 13) and AGND (pin 9). The SENSE+ pin (pin 14) must be connected to VOUT either at the load for improved regulation or at VOUT of the device.

The LMZ31520 relies on a precision trimmed 0.6 V reference for the feedback voltage regulation and operates by regulating the valley of the voltage ripple appearing at the VADJ pin. The voltage ripple is a function of the input voltage and the output voltage, therefore the R_{SET} resistor will change based on the input voltage. Table 1 gives the calculated external R_{SET} resistor for a number of common bus voltages for PVIN of 12 V, 5 V, and 3.3 V. The recommended switching frequency is 500 kHz which can be configured by leaving the FREQ_SEL pin open. To adjust the frequency, see Table 2.

Table 1. R_{SET} Resistor Values

	R_{SET} (Ω)				R_{SET} (Ω)		
V_{OUT} (V)	PVIN = 12 V	PVIN = 5 V	PVIN = 3.3 V	V_{OUT} (V)	PVIN = 12 V	PVIN = 5 V	PVIN = 3.3 V

2.10	585	581	578				

Frequency Select

The LMZ31520 switching frequency can be selected from several values as shown in Table 2. To select a switching frequency, a resistor (R_{FREQ}) must be connected between the FREQ_SEL pin and either PGND or V5V (pin 61) as shown in Table 2. For all output voltages, the recommended switching frequency is 500 kHz which can be configured by leaving the FREQ_SEL pin open. Table 2 also shows the output voltage range for each frequency.

Table 2. Frequency Selection

Frequency Select (kHz)	R_{FREQ} (kΩ)	Connect To	V_{OUT} RANGE (V)	
			MIN	MAX
300	66	PGND	0.6	3.6
400	498	PGND	0.6	3.6
500	open	-	0.6	3.6
650	745	V5V	0.8	3.6
750	188	V5V	1.0	3.6
850	short	V5V	1.2	3.6

CAPACITOR RECOMMENDATIONS FOR THE LMZ31520 POWER SUPPLY

Capacitor Technologies

Electrolytic, Polymer-Electrolytic Capacitors

Aluminum electrolytic capacitors provide adequate decoupling over the frequency range of 2 kHz to 150 kHz. When using electrolytic capacitors, high-quality, polymer-electrolytic capacitors are recommended. Polymer-electrolytic type capacitors are recommended for applications where the ambient operating temperature is less than 0°C. The Panasonic OS-CON capacitor series is suggested due to the lower ESR, higher rated surge, power dissipation, ripple current capability, and small package size.

Ceramic Capacitors

The performance of ceramic capacitors is most effective above 150 kHz. Multilayer ceramic capacitors have a low ESR and a resonant frequency higher than the bandwidth of the regulator. They can be used to reduce the reflected ripple current at the input as well as improve the transient response of the output.

Tantalum, Polymer-Tantalum Capacitors

Polymer-tantalum type capacitors are recommended for applications where the ambient operating temperature is less than 0°C. The Panasonic POSCAP series and Kemet T530 capacitor series are recommended rather than many other tantalum types due to their lower ESR, higher rated surge, power dissipation, ripple current capability, and small package size. Tantalum capacitors that have no stated ESR or surge current rating are not recommended for power applications.

Input Capacitor

The LMZ31520 requires a minimum input capacitance of 44 µF of ceramic type. The voltage rating of input capacitors must be greater than the maximum input voltage. The input RMS ripple current is a function of the output current and the duty cycle for any application. The input capacitor must be rated for the application's RMS ripple current. Table 3 includes a preferred list of capacitors by vendor.

Output Capacitor

The required output capacitance of the LMZ31520 can be comprised of either all ceramic capacitors, or a combination of ceramic and bulk capacitors. The required output capacitance must include at least 100 µF of ceramic type. When adding additional non-ceramic bulk capacitors, low-ESR devices like the ones recommended in Table 3 are required. The required capacitance above the minimum is determined by actual transient deviation requirements. See Table 4 for typical transient response values for several output voltage, input voltage and capacitance combinations. Table 3 includes a preferred list of capacitors by vendor.

Table 3. Recommended Input/Output Capacitors (1)

VENDOR	SERIES	PART NUMBER	CAPACITOR CHARACTERISTICS		
			WORKING VOLTAGE (V)	CAPACITANCE (µF)	ESR (2) (mΩ)

(1) **Capacitor Supplier Verification, RoHS, Lead-free and Material Details**
Consult capacitor suppliers regarding availability, material composition, RoHS and lead-free status, and manufacturing process requirements for any capacitors identified in this table.
(2) Maximum ESR @ 100kHz, 25°C.

Transient Response

The LMZ31520 is designed to have an ultra-fast load step response with minimal output capacitance. Table 4 shows the voltage deviation and recovery time for several different transient conditions. Several transient waveforms are shown in Transient Waveforms (3).

Table 4. Output Voltage Transient Response

C_{IN1} = 3 x 47 µF CERAMIC

(1) Device configured for FCCM mode of operation, (pin 3 connected to pin 19).

Application Schematics

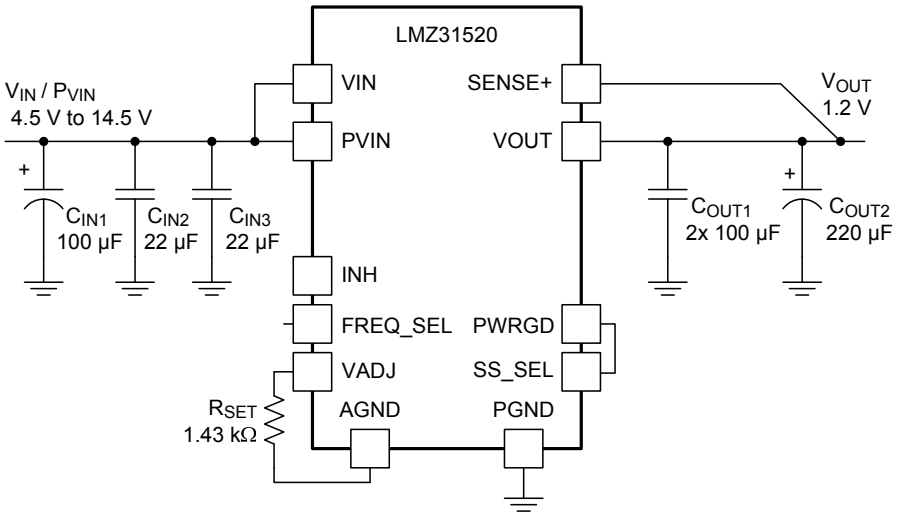

Figure 14. Typical Schematic
PVIN = VIN = 4.5 V to 14.5 V, VOUT = 1.2 V

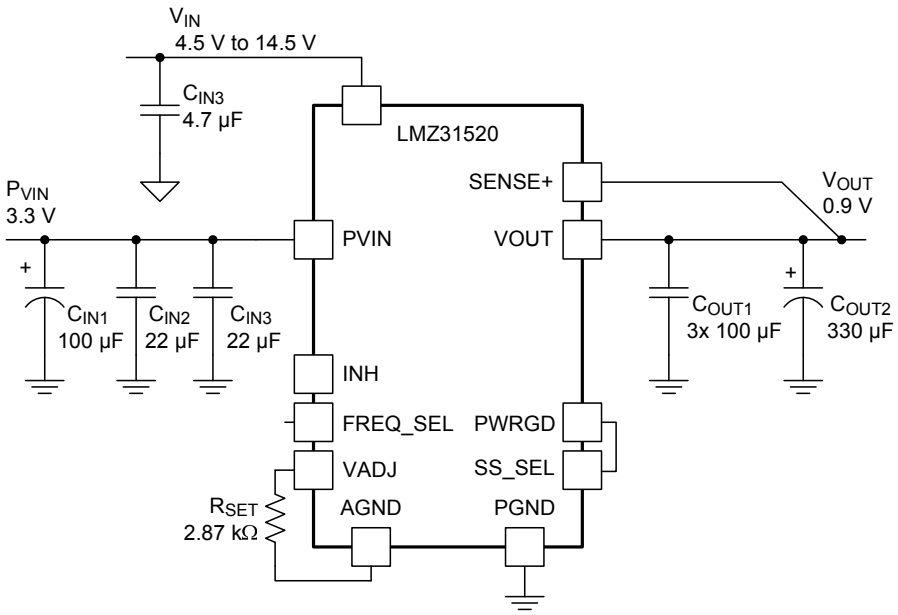

Figure 15. Typical Schematic
PVIN = 3.3 V, VIN = 4.5 V to 14.5 V, VOUT = 0.9 V

VIN and PVIN Input Voltage

The LMZ31520 allows for a variety of applications by using the VIN and PVIN pins together or separately. The VIN voltage supplies the internal control circuits of the device. The PVIN voltage provides the input voltage to the power converter system.

If tied together, the input voltage for the VIN pin and the PVIN pin can range from 4.5 V to 14.5 V. If using the VIN pin separately from the PVIN pin, the VIN pin must be greater than 4.5 V, and the PVIN pin can range from as low as 3.0 V to 14.5 V. When operating from a split rail, it is recommended to supply VIN from 5 V to 12 V, for best performance.

3.3 V PVIN Operation

Applications operating from a PVIN of 3.3 V must provide at least 4.5 V for VIN. It is recommended to supply VIN from 5 V to 12 V, for best performance. See application note, SNVA692 for help creating 5 V from 3.3 V using a small, simple charge pump device.

Power Good (PWRGD)

The PWRGD pin is an open drain output. Once the voltage on the SENSE+ pin is between 90% and 115% of the set voltage, the PWRGD pin pull-down is released and the pin floats. The recommended pull-up resistor value is between 10 kΩ and 100 kΩ to a voltage source that is less than 7 V. An internal 100 kΩ pull-up resistor is provided internal to the device between the PWRGD pin (pin 19) and PWRGD_PU pin (pin 18). The PWRGD_PU pin can be connected to a voltage source less than 7 V or connected directly to V5V (pin 61), which is an internal 5V regulator. The PWRGD pin is in a defined state once VIN is greater than 1.0 V. The PWRGD pin is pulled low when the voltage on SENSE+ is lower than 90% or greater than 115% of the nominal set voltage. Also, the PWRGD pin is pulled low if the input UVLO or thermal shutdown is asserted or the INH pin is pulled low.

Slow Start (SS_SEL)

Connecting the SS_SEL pin to PWRGD or PGND sets the slow start interval of approximately 0.7 ms. The connection to either PWRGD or PGND determines the mode of the LMZ31520 as decribed in Auto-Skip Eco-Mode ™ / Forced Continuous Conduction Mode. Adding a resistor between SS_SEL pin and PWRGD or PGND increases the slow start time. Increasing the slow start time will reduce inrush current.Table 5 shows a resistor connected between SS_SEL pin and PWRGD to select FCCM and Figure 17 shows a resistor between SS_SEL pin and PGND to select Auto-skip mode. See Table 5 below for SS resistor values and timing interval.

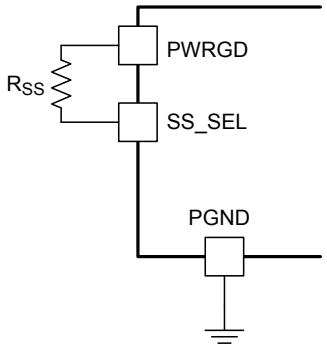

Figure 16. Slow-Start Resistor (R_{SS}) in FCCM

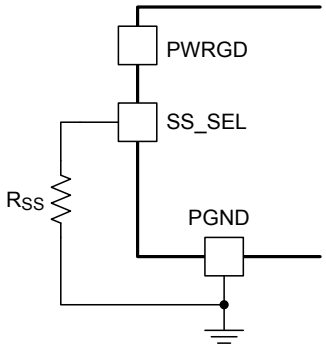

Figure 17. Slow-Start Resistor (R_{SS}) in Auto-skip Mode

Table 5. Slow-Start Resistor Values and Slow-Start Time

R_{SS} (kΩ)	short	61.9	161	436
SS Time (msec)	0.7	1.4	2.8	5.6

Auto-Skip Eco-Mode ™ / Forced Continuous Conduction Mode

Auto-skip Eco-mode or Forced Continuous Conduction Mode (FCCM) can be selected using the SS_SEL pin (pin 3). Connect the SS_SEL pin to PGND to select Auto-skip Eco-mode or to the PWRGD pin to select FCCM.

In Auto-skip Eco-mode, the LMZ31520 automatically reduces the switching frequency at light load conditions to maintain high efficiency. In FCCM, the controller keeps continuous conduction mode in light load condition and the switching frequency is kept almost constant over the entire load range. Transient performance is best in FCCM.

Power-Up Characteristics

When configured as shown in the front page schematic, the LMZ31520 produces a regulated output voltage following the application of a valid input voltage. During the power-up, internal soft-start circuitry slows the rate that the output voltage rises, thereby limiting the amount of in-rush current that can be drawn from the input source. Figure 18 shows the start-up waveforms for a LMZ31520, operating from a 5-V input (PVIN=VIN) and with the output voltage adjusted to 1.8 V. Figure 19 shows the start-up waveforms for a LMZ31520 starting up into a pre-biased output voltage. The waveforms were measured with a 15-A constant current load.

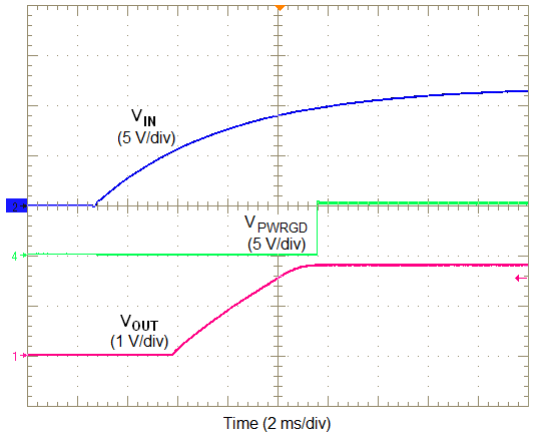

Figure 18. Start-Up Waveforms

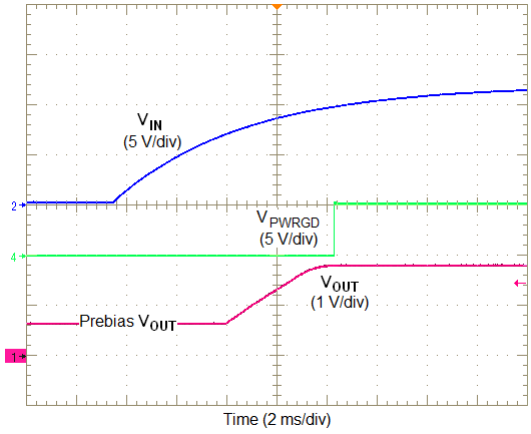

Figure 19. Start-up into Pre-bias

Pre-Biased Start-Up

The LMZ31520 has been designed to prevent the low-side MOSFET from discharging a pre-biased output. During pre-biased startup, the low-side MOSFET does not turn on until the high-side MOSFET has started switching. The high-side MOSFET does not start switching until the slow start voltage exceeds the voltage on the VADJ pin. Refer to Figure 19.

Remote Sense

The SENSE+ pin must be connected to V_{OUT} at the load, or at the device pins.

Connecting the SENSE+ pin to V_{OUT} at the load improves the load regulation performance of the device by allowing it to compensate for any I-R voltage drop between its output pins and the load. An I-R drop is caused by the high output current flowing through the small amount of pin and trace resistance. This should be limited to a maximum of 300 mV.

NOTE

The remote sense feature is not designed to compensate for the forward drop of nonlinear or frequency dependent components that may be placed in series with the converter output. Examples include OR-ing diodes, filter inductors, ferrite beads, and fuses. When these components are enclosed by the SENSE+ connection, they are effectively placed inside the regulation control loop, which can adversely affect the stability of the regulator.

Output On/Off Inhibit (INH)

The INH pin provides electrical on/off control of the device. Once the INH pin voltage exceeds the threshold voltage, the device starts operation. If the INH pin voltage is pulled below the threshold voltage, the regulator stops switching and enters low quiescent current state.

The INH pin has an internal pull-up current source, allowing the user to float the INH pin for enabling the device. If an application requires controlling the INH pin, use an open drain/collector device, or a suitable logic gate to interface with the pin.

Figure 20 shows the typical application of the inhibit function. The Inhibit control has its own internal pull-up to VIN potential. An open-collector or open-drain device is recommended to control this input.

Turning Q1 on applies a low voltage to the inhibit control (INH) pin and disables the output of the supply, shown in Figure 21. If Q1 is turned off, the supply executes a soft-start power-up sequence, as shown in Figure 22. A regulated output voltage is produced within 2 ms. The waveforms were measured with a 5-A constant current load.

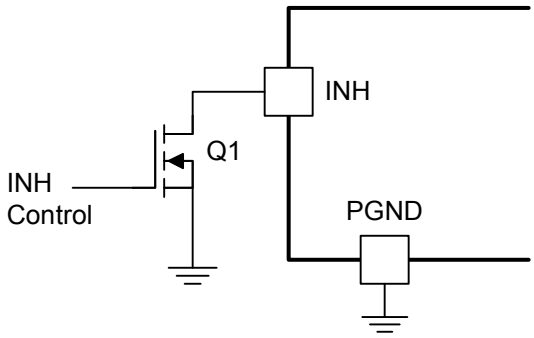

Figure 20. Typical Inhibit Control

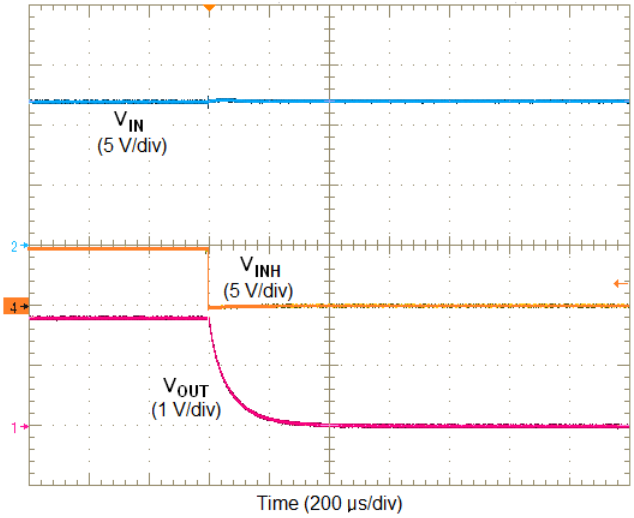

Figure 21. Inhibit Turn-Off

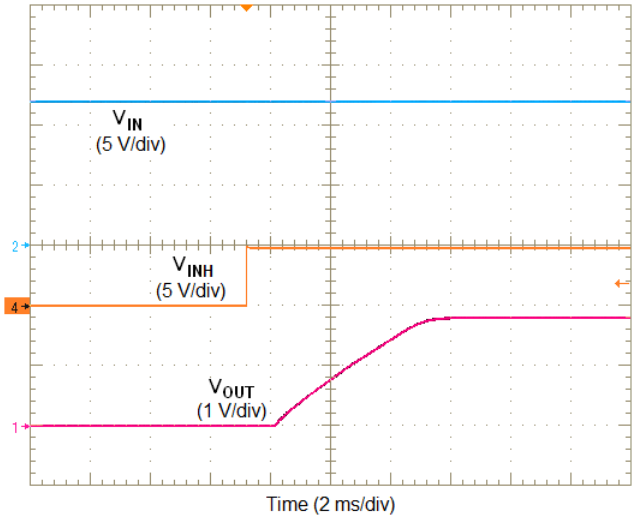

Figure 22. Inhibit Turn-On

Overcurrent Protection

For protection against load faults, the LMZ31520 incorporates cycle-by-cycle overcurrent limiting control. The inductor current is monitored during the OFF state and the controller maintains the OFF state during the period in that the inductor current is larger than the overcurrent trip level. In cycle-by-cycle mode, applying a load that exceeds the regulator's overcurrent threshold limits the output current and reduces the output voltage as shown in Figure 23. If the overcurrent condition remains and the output voltage drops below 70% of the set-point, the LMZ31520 shuts down. Following shutdown, the module periodically attempts to recover by initiating a soft-start power-up as shown in Figure 23. This is described as a hiccup mode of operation, whereby the module continues in a cycle of successive shutdown and power up until the load fault is removed. During this period, the average current flowing into the fault is significantly reduced which reduces power dissipation. Once the fault is removed, the module automatically recovers and returns to normal operation as shown in Figure 24.

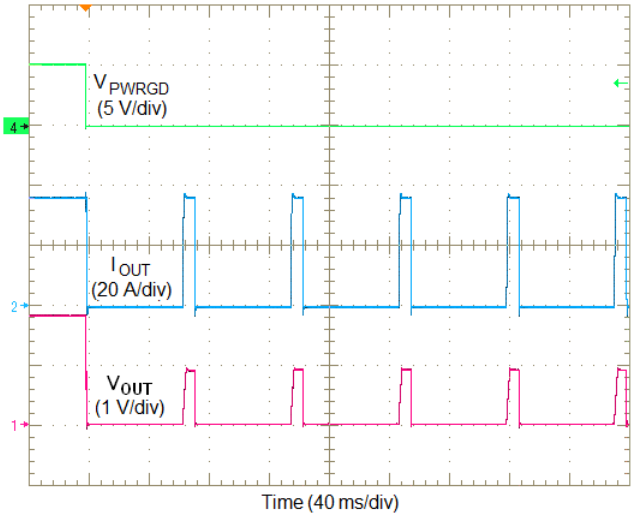

Figure 23. Typical Overcurrent Limiting

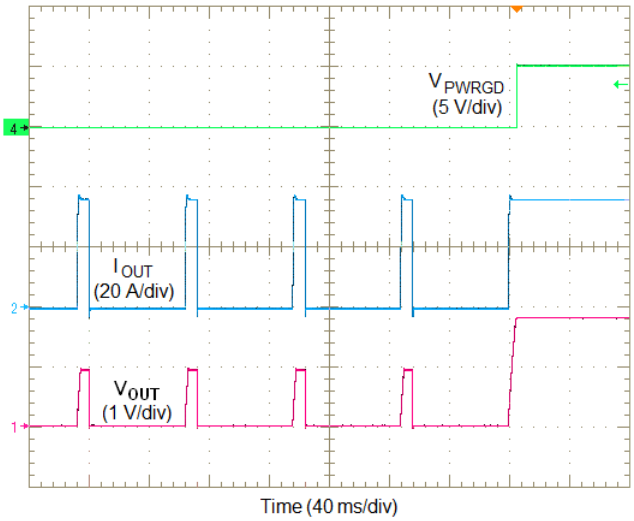

Figure 24. Typical Removal of Overcurrent

Current Limit (ILIM) Adjust

The current limit of this device can be adjusted lower by connecting a resistor, R_{ILIM}, between the ILIM pin (pin 6) and PGND. To adjust the typical current limit threshold, as listed in the electrical characteristics table, refer to Table 6.

Table 6. Current Limit Adjust Resistor

Current Limit Reduction	R_{ILIM} (kΩ)
10 %	715
20 %	383
30 %	243

Thermal Shutdown

The internal thermal shutdown circuitry forces the device to stop switching if the junction temperature exceeds 145°C typically. The device reinitiates the power up sequence when the junction temperature drops below 135°C typically.

Layout Considerations

To achieve optimal electrical and thermal performance, an optimized PCB layout is required. Figure 25 thru Figure 30, shows a typical PCB layout. Some considerations for an optimized layout are:

- Use large copper areas for power planes (PVIN, VOUT, and PGND) to minimize conduction loss and thermal stress.
- Place ceramic input and output capacitors close to the device pins to minimize high frequency noise.
- Locate additional output capacitors between the ceramic capacitor and the load.
- Keep AGND and PGND separate from one another. AGND should only be used as the return for R_{SET}.
- Place R_{SET}, R_{FREQ}, and R_{SS} as close as possible to their respective pins.
- Use multiple vias to connect the power planes to internal layers.

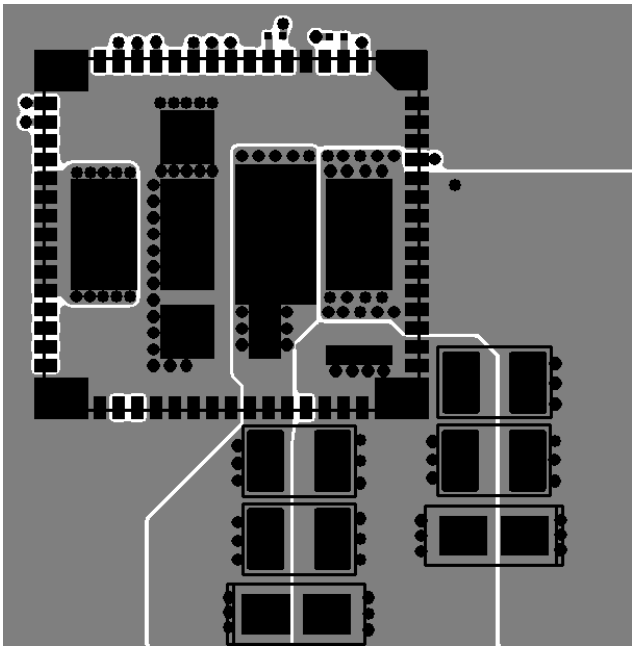

Figure 25. Typical Top Layer Layout

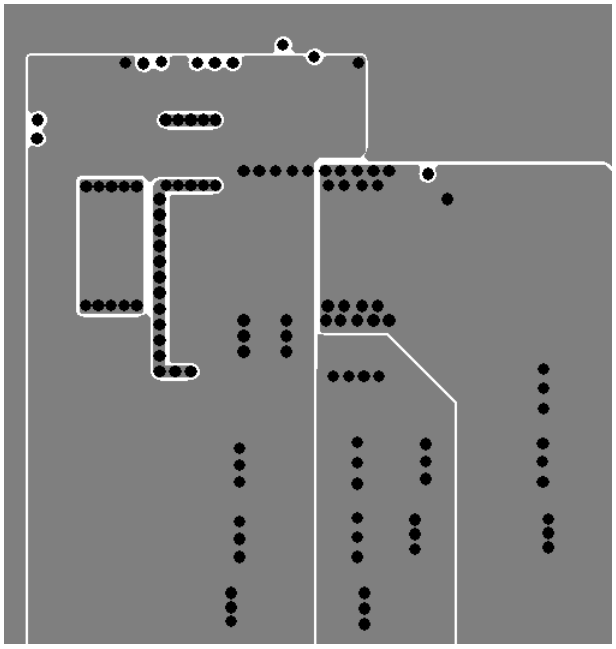

Figure 26. Typical Layer 2 Layout

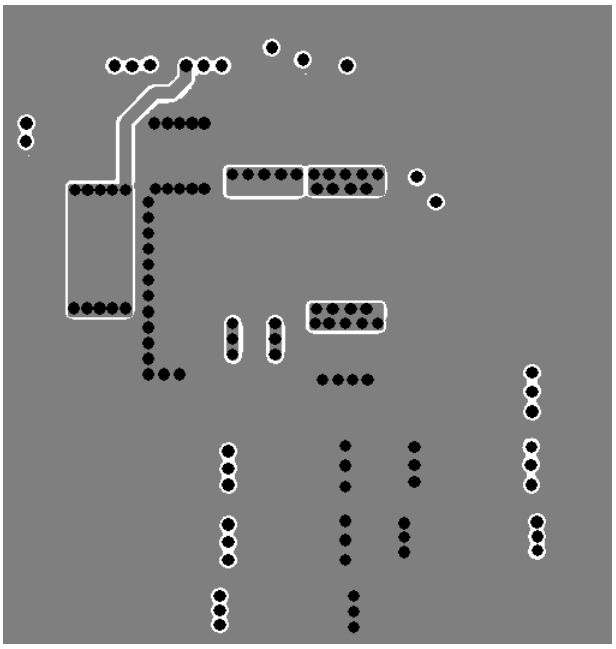

Figure 27. Typical Layer 3 Layout

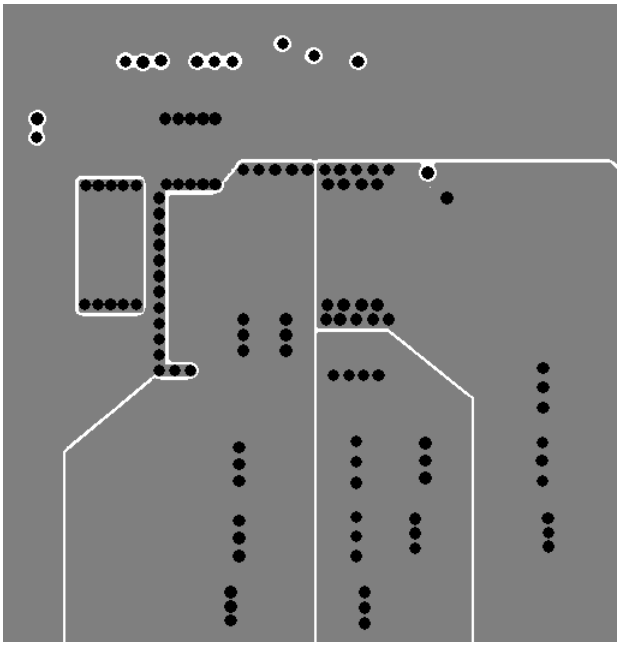

Figure 28. Typical Layer 4 Layout

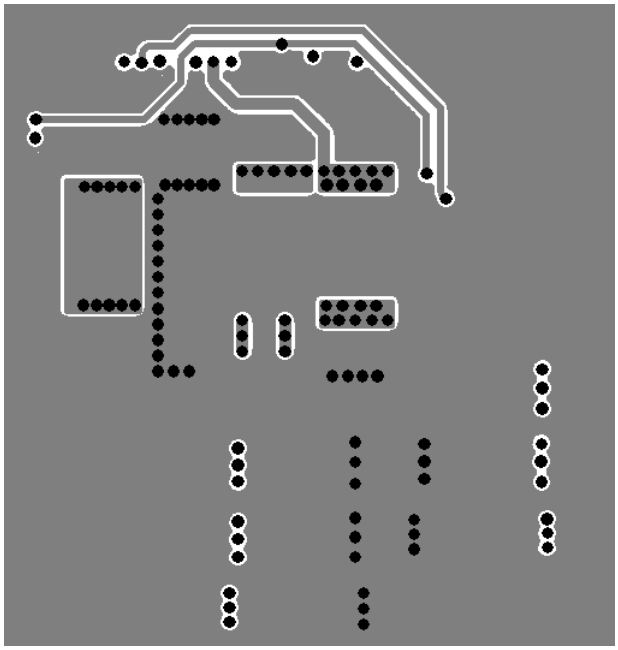

Figure 29. Typical Layer 5 Layout

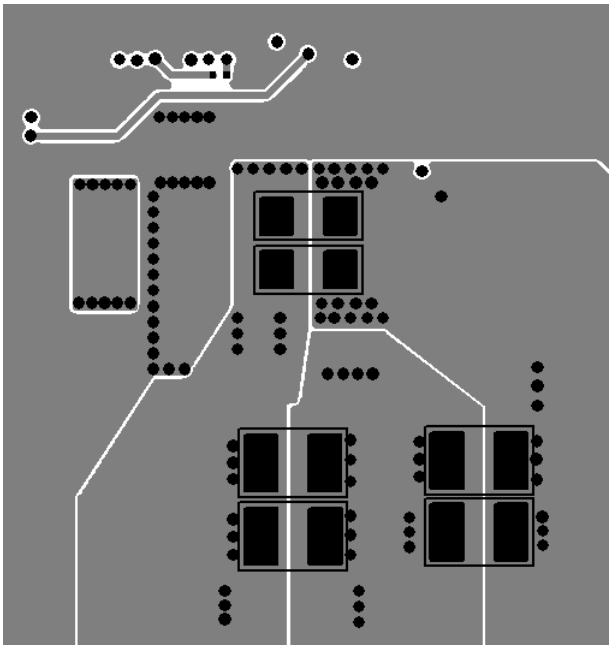

Figure 30. Typical Bottom Layer Layout

EMI

The LMZ31520 is compliant with EN55022 Class A radiated emissions. Figure 31 and Figure 32 show typical examples of radiated emissions plots for the LMZ31520 operating from 5V and 12V respectively. Both graphs include the plots of the antenna in the horizontal and vertical positions.

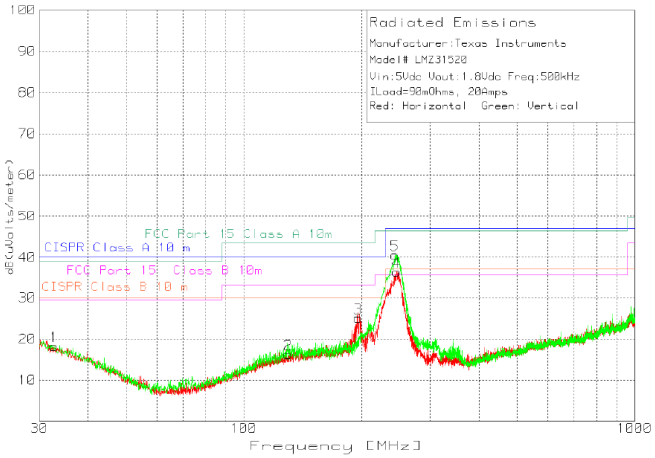

Figure 31. Radiated Emissions 5-V Input, 1.8-V Output, 20-A Load (EN55022 Class A)

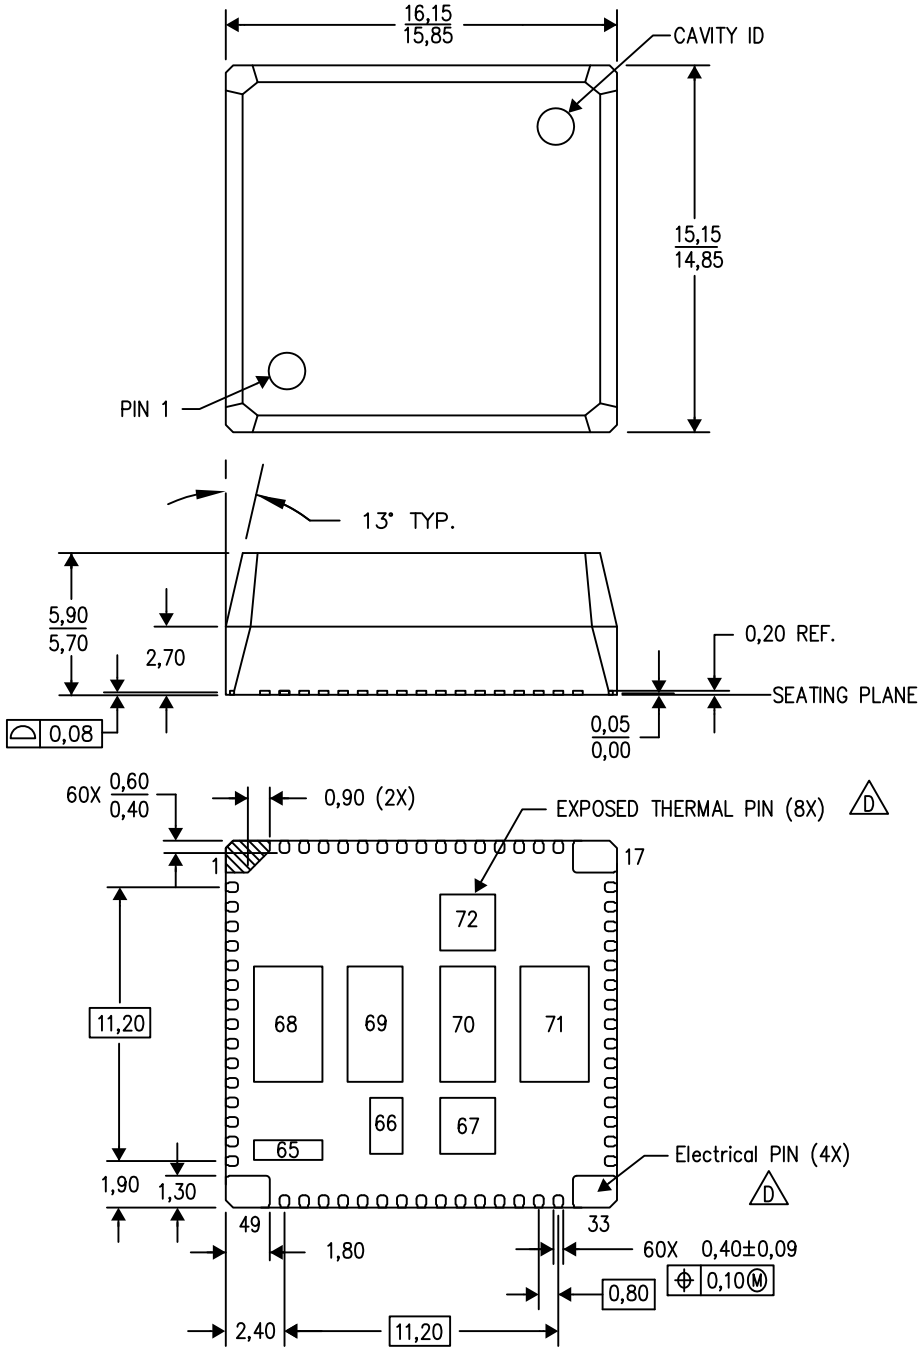
REVISION HISTORY

Changes from Revision A (December 2013) to Revision B	Page
• Added additional capacitors to the recommended capacitor table	13

Changes from Original (October 2013) to Revision A	Page
• Changed status from Preview to Production	1

RLG (R–PB4QFN–N72) PLASTIC QUAD FLATPACK NO–LEAD



NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M–1994.
B. This drawing is subject to change without notice.
C. Quad Flatpack, No–leads (QFN) package configuration.
D. The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
E. The package thermal performance may be enhanced by bonding the thermal pad to an external thermal plane..

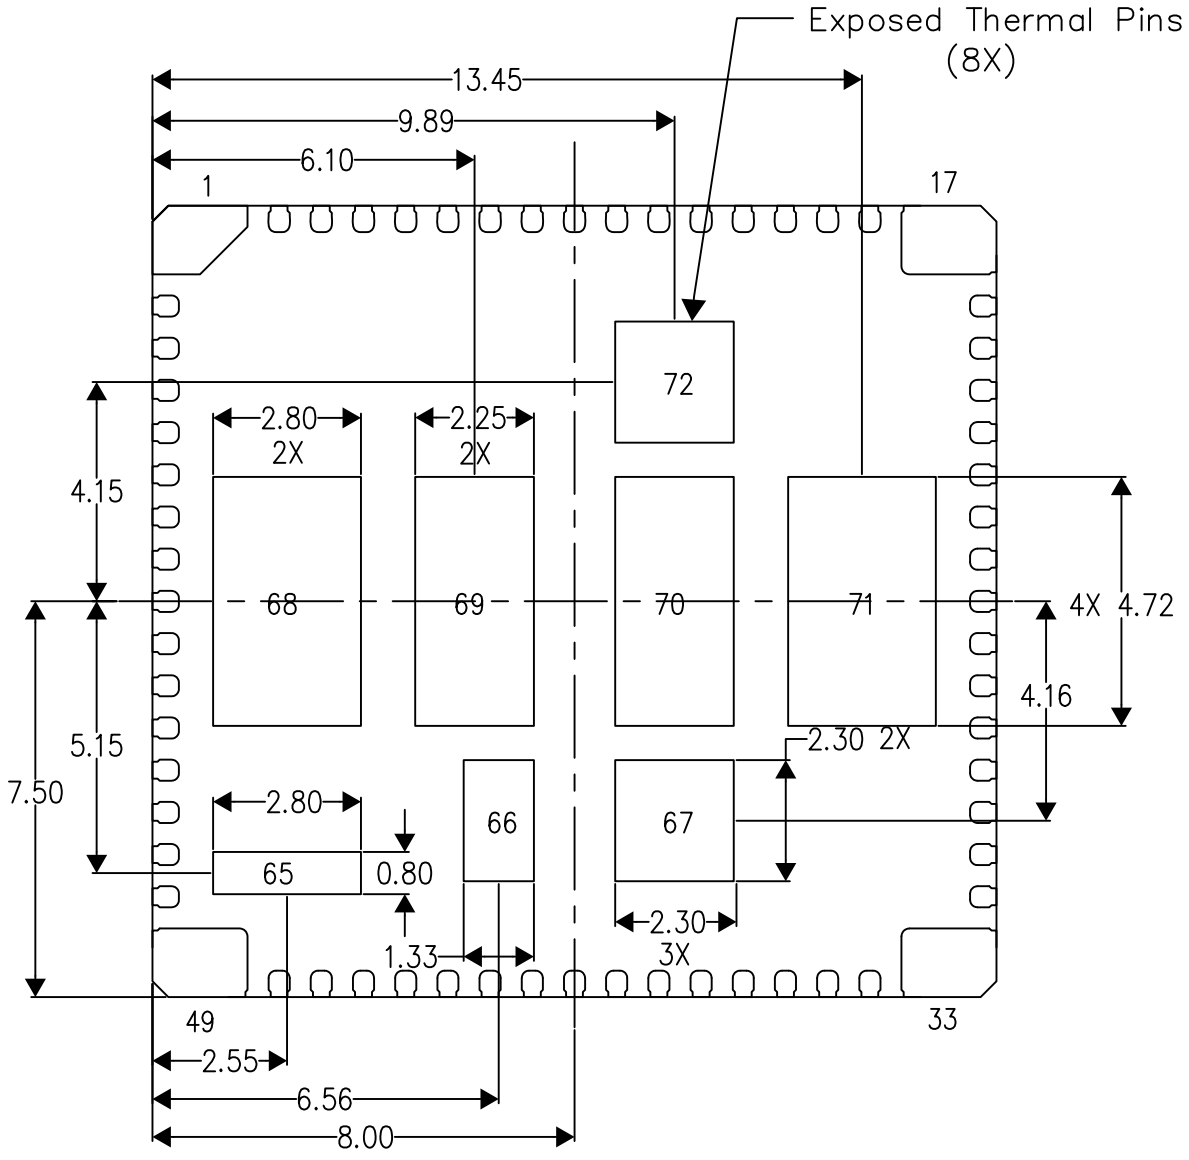
RLG (R–PB4QFN–N72) PLASTIC QUAD FLATPACK NO–LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No–Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.



Bottom View

Exposed Thermal Pad Dimensions

Thermal Pad Tolerance: ±0.10mm

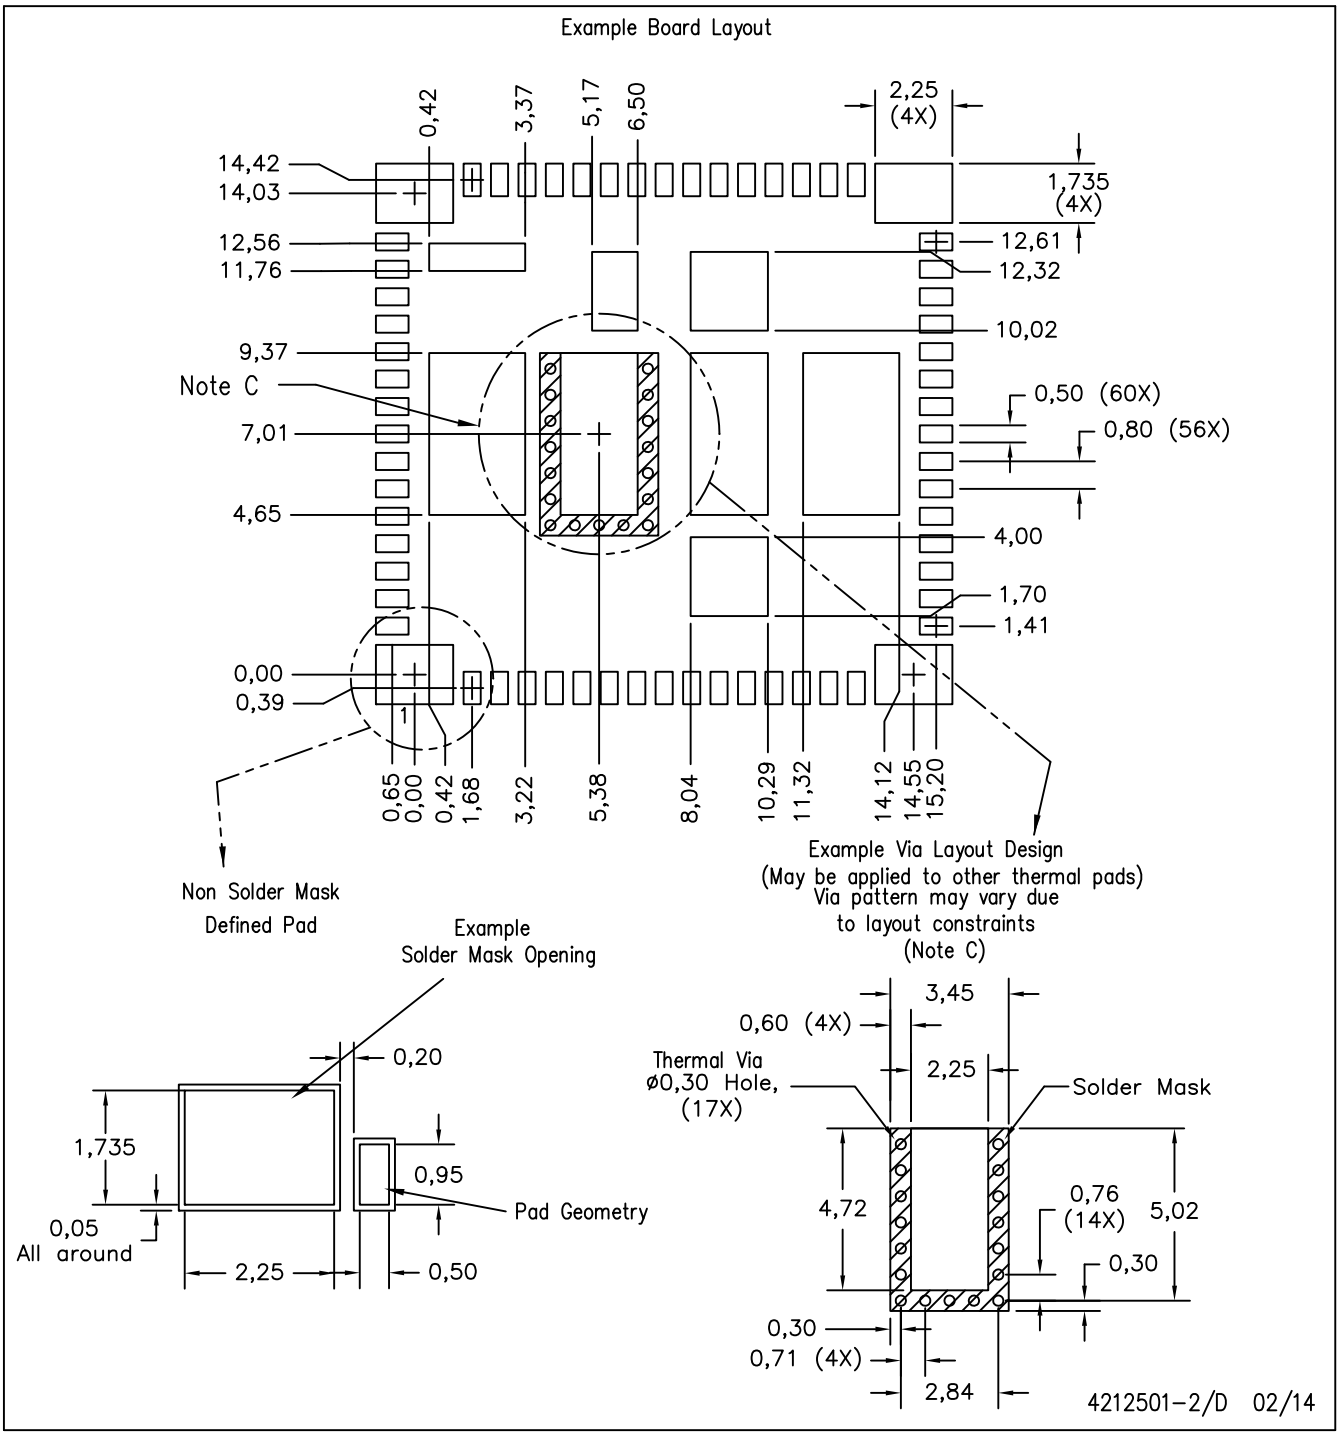
NOTE: All linear dimensions are in millimeters

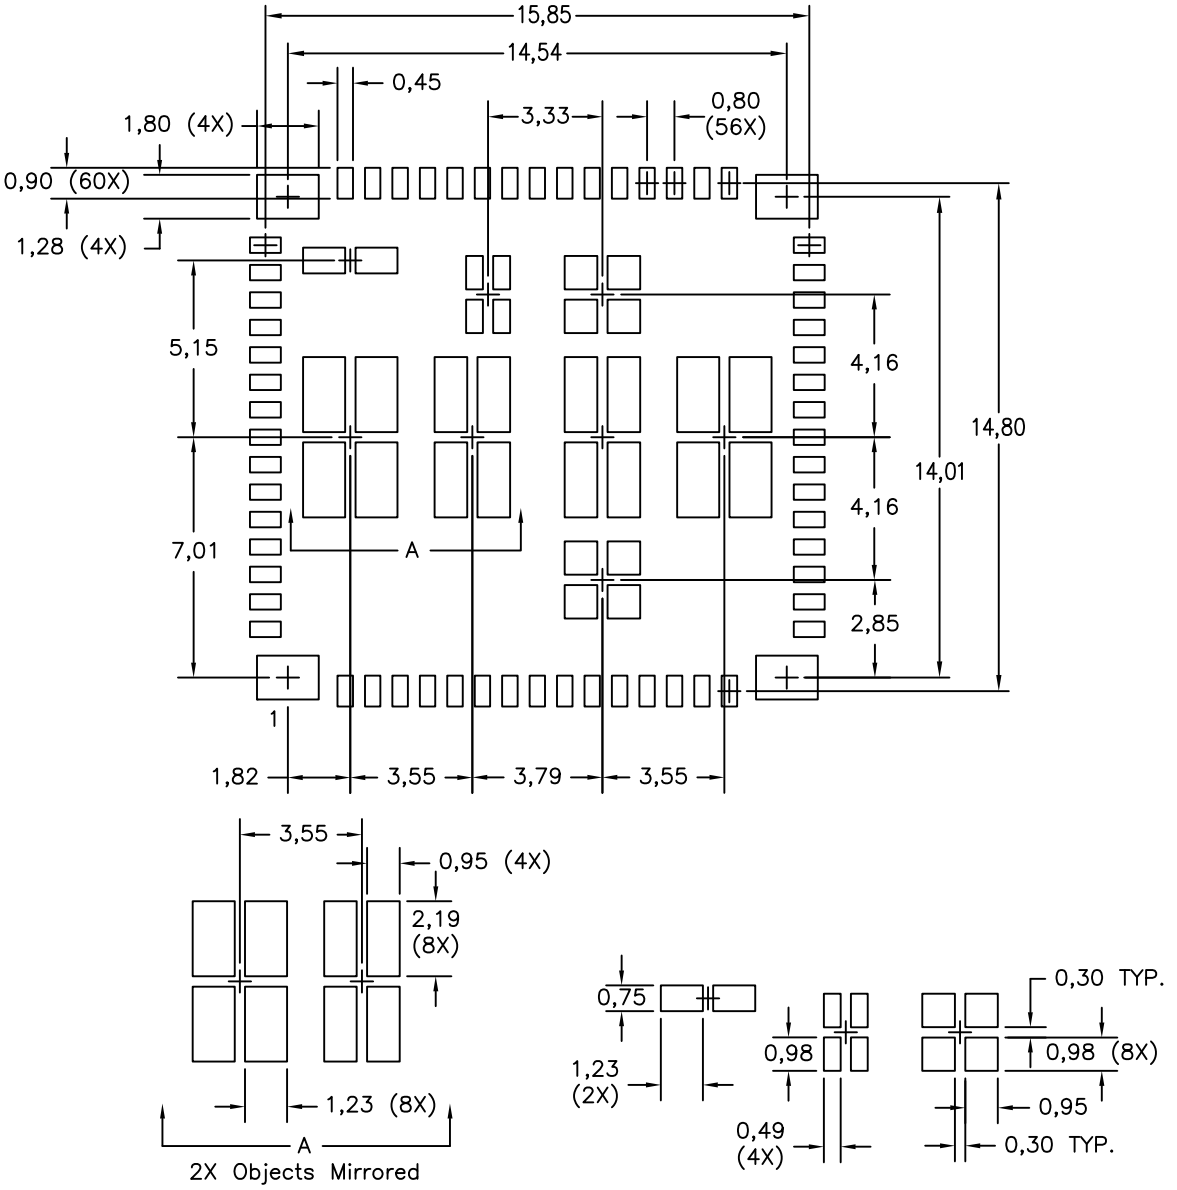
RLG (R–PB4QFN–N72) PLASTIC QUAD FLATPACK NO–LEAD



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. This package is designed to be soldered to thermal pads on the board. Refer to Application Note, Quad Flat–Pack Package, Texas Instruments Literature No. SCBA017, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>.
D. See sheet 3 for stencil design recommendation.

RLG (R–PB4QFN–N72) PLASTIC QUAD FLATPACK NO–LEAD

Example Stencil Design (Note E)
Stencil Thickness = 0,125mm



4212501–3/D 02/14

NOTES:

E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Costumer should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMZ31520RLGT	ACTIVE	BQFN	RLG	72	250	TBD	Call TI	Call TI	-40 to 85	LMZ31520	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
