
CC110L Value Line Transceiver

1 Device Overview

1.1 Features

- **RF Performance**
 - Programmable Output Power up to +12 dBm
 - Receive Sensitivity Down to –116 dBm at 0.6 kbps
 - Programmable Data Rate from 0.6 to 600 kbps
 - Frequency Bands: 300–348 MHz, 387–464 MHz, and 779–928 MHz
 - 2-FSK, 4-FSK, GFSK, MSK, and OOK Supported
- **Digital Features**
 - Flexible Support for Packet Oriented Systems
 - On-chip Support for Sync Word Insertion, Flexible Packet Length, and Automatic CRC Calculation
- **Low-Power Features**
 - 200-nA Sleep Mode Current Consumption
 - Fast Startup Time; 240 μ s From Sleep to RX Mode or TX Mode
 - 64-Byte RX and TX FIFO
- **Improved Range Using CC1190**
 - The CC1190 is a Range Extender for 850–950 MHz and is an Ideal Fit for CC110L to Enhance RF Performance
 - High Sensitivity
 - –118 dBm at 1.2 kBaud, 868 MHz, 1% Packet Error Rate
 - –120 dBm at 1.2 kBaud, 915 MHz, 1% Packet Error Rate
 - +20-dBm Output Power at 868 MHz
 - +26-dBm Output Power at 915 MHz
- **General**
 - Few External Components; Completely On-chip Frequency Synthesizer, No External Filters or RF Switch Needed
 - Green Package: RoHS Compliant and No Antimony or Bromine
 - Small Size (QLP 4- x 4-mm Package, 20 Pins)
 - Suited for Systems Targeting Compliance with EN 300 220 (Europe) and FCC CFR Part 15 (US)
 - Support for Asynchronous and Synchronous Serial Transmit Mode for Backward Compatibility with Existing Radio Communication Protocols

1.2 Applications

- Ultra Low-Power Wireless Applications Operating in the 315-, 433-, 868-, 915-MHz ISM or SRD Bands
- Wireless Alarm and Security Systems
- Industrial Monitoring and Control
- Remote Controls
- Toys
- Home and Building Automation

1.3 Description

The CC110L is a cost optimized sub-1 GHz RF transceiver for the 300–348 MHz, 387–464 MHz, and 779–928 MHz frequency bands. The circuit is based on the popular CC1101 RF transceiver, and RF performance characteristics are identical. Two CC110L transceivers together enable a low-cost bidirectional RF link.

The RF transceiver is integrated with a highly configurable baseband modem. The modem supports various modulation formats and has a configurable data rate up to 600 kbps.

The CC110L provides extensive hardware support for packet handling, data buffering, and burst transmissions.

The main operating parameters and the 64-byte receive and transmit FIFOs of CC110L can be controlled through a serial peripheral interface (SPI). In a typical system, the CC110L will be used together with a microcontroller and a few additional passive components.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE
CC110LRGP	QFN (20)	4.00 mm x 4.00 mm

(1) For more information on these devices, see [Section 8](#), Mechanical Packaging and Orderable Information.

1.4 Functional Block Diagram

Figure 1-1 shows a functional block diagram of the device.

2 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (September 2011) to Revision B	Page
• Changed format of data sheet to standard TI format.	1
• Changed reset value from 0x07 to 0x17	76
• Changed the package designator from RTK to RGP	88

3 Terminal Configuration and Functions

3.1 Pin Diagram

The CC110L pinout is shown in [Figure 3-1](#) and [Table 3-1](#). See [Section 5.25](#) for details on the I/O configuration.

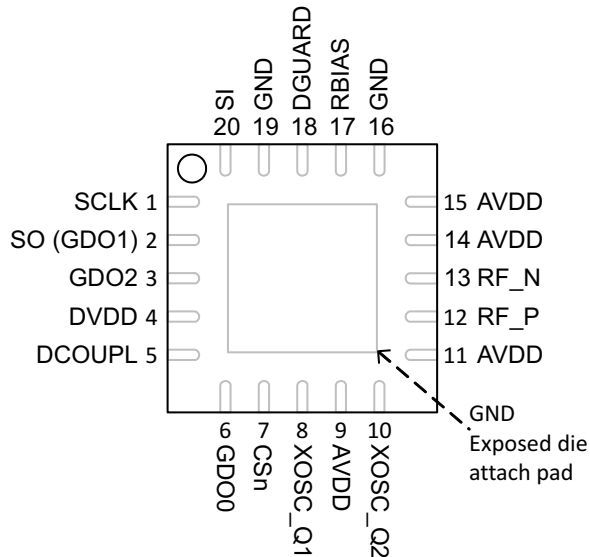

Figure 3-1. Pinout Top View

3.2 Signal Descriptions

Table 3-1. Signal Descriptions

Pin No.	Pin Name	Pin Type	Description
1	SCLK	Digital Input	Serial configuration interface, clock input
2	SO (GDO1)	Digital Output	Serial configuration interface, data output Optional general output pin when CSn is high
3	GDO2	Digital Output	Digital output pin for general use: <ul style="list-style-type: none"> • Test signals • FIFO status signals • Clear channel indicator • Clock output, down-divided from XOSC • Serial output RX data
4	DVDD	Power (Digital)	1.8 - 3.6 V digital power supply for digital I/O's and for the digital core voltage regulator
5	DCOUPPL	Power (Digital)	1.6 - 2.0 V digital power supply output for decoupling NOTE: This pin is intended for use with the CC110L only. It can not be used to provide supply voltage to other devices
6	GDO0	Digital I/O	Digital output pin for general use: <ul style="list-style-type: none"> • Test signals • FIFO status signals • Clear channel indicator • Clock output, down-divided from XOSC • Serial output RX data • Serial input TX data
7	CSn	Digital Input	Serial configuration interface, chip select
8	XOSC_Q1	Analog I/O	Crystal oscillator pin 1, or external clock input
9	AVDD	Power (Analog)	1.8 - 3.6 V analog power supply connection
10	XOSC_Q2	Analog I/O	Crystal oscillator pin 2
11	AVDD	Power (Analog)	1.8 - 3.6 V analog power supply connection
12	RF_P	RF I/O	Positive RF input signal to LNA in receive mode Positive RF output signal from PA in transmit mode
13	RF_N	RF I/O	Negative RF input signal to LNA in receive mode Negative RF output signal from PA in transmit mode
14	AVDD	Power (Analog)	1.8 - 3.6 V analog power supply connection
15	AVDD	Power (Analog)	1.8 - 3.6 V analog power supply connection
16	GND	Ground (Analog)	Analog ground connection
17	RBIAS	Analog I/O	External bias resistor for reference current
18	DGUARD	Power (Digital)	Power supply connection for digital noise isolation
19	GND	Ground (Digital)	Ground connection for digital noise isolation
20	SI	Digital Input	Serial configuration interface, data input

4 Specifications

4.1 Absolute Maximum Ratings

Under no circumstances must the absolute maximum ratings be violated. Stress exceeding one or more of the limiting values may cause permanent damage to the device.

Parameter	Min	Max	Units	Condition
Supply voltage	-0.3	3.9	V	All supply pins must have the same voltage
Voltage on any digital pin	-0.3	VDD + 0.3, max 3.9	V	
Voltage on the pins RF_P, RF_N, DCOUPL, RBIAS	-0.3	2.0	V	
Voltage ramp-up rate		120	kV/ μ s	
Input RF level		+10	dBm	

4.2 Handling Ratings

Parameter		MIN	MAX	UNIT
Storage temperature range, T _{stg}	(default)	-50	150	°C
ESD Stress Voltage, V _{ESD}	Human Body Model (HBM), per ANSI/ESDA/JEDEC JS001 ⁽¹⁾		750	V
	Charged Device Model (CDM), per JESD22-C101 ⁽²⁾		400	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V HBM allows safe manufacturing with a standard ESD control process.

4.3 Recommended Operating Conditions

Parameter	Min	Max	Unit	Condition
Operating temperature	-40	85	°C	
Operating supply voltage	1.8	3.6	V	All supply pins must have the same voltage

4.4 General Characteristics

Parameter	Min	Typ	Max	Unit	Condition
Frequency range	300		348	MHz	
	387		464	MHz	If using a 27 MHz crystal, the lower frequency limit for this band is 392 MHz
	779		928	MHz	
Data rate	0.6		500	kBaud	2-FSK
	0.6		250	kBaud	GFSK and OOK
	0.6		300	kBaud	4-FSK (the data rate in kbps will be twice the baud rate) Optional Manchester encoding (the data rate in kbps will be half the baud rate)

4.5 Current Consumption

$T_A = 25^\circ\text{C}$, $V_{DD} = 3.0\text{ V}$ if nothing else stated. All measurement results are obtained using [SWRR046](#) and [SWRR045](#). Reduced current settings, [MDMCFG2.DEM_DCFILT_OFF=1](#), gives a slightly lower current consumption at the cost of a reduction in sensitivity. See [Section 4.7](#) for additional details on current consumption and sensitivity.

Parameter	Min	Typ	Max	Unit	Condition
Current consumption in power down modes		0.2	1	μA	Voltage regulator to digital part off, register values retained (SLEEP state). All GDO pins programmed to 0x2F (HW to 0)
		100		μA	Voltage regulator to digital part off, register values retained, XOSC running (SLEEP state with MCSM0.OSC_FORCE_ON set)
		165		μA	Voltage regulator to digital part on, all other modules in power down (XOFF state)
Current consumption		1.7		mA	Only voltage regulator to digital part and crystal oscillator running (IDLE state)
		8.4		mA	Only the frequency synthesizer is running (FSTXON state). This current consumption is also representative for the other intermediate states when going from IDLE to RX or TX, including the calibration state
Current consumption, 315 MHz		15.4		mA	Receive mode, 1.2 kBaud, reduced current, input at sensitivity limit
		14.4		mA	Receive mode, 1.2 kBaud, register settings optimized for reduced current, input well above sensitivity limit
		15.2		mA	Receive mode, 38.4 kBaud, register settings optimized for reduced current, input at sensitivity limit
		14.3		mA	Receive mode, 38.4 kBaud, register settings optimized for reduced current, input well above sensitivity limit
		16.5		mA	Receive mode, 250 kBaud, register settings optimized for reduced current, input at sensitivity limit
		15.1		mA	Receive mode, 250 kBaud, register settings optimized for reduced current, input well above sensitivity limit
		27.4		mA	Transmit mode, +10 dBm output power
		15.0		mA	Transmit mode, 0 dBm output power
Current consumption, 433 MHz		12.3		mA	Transmit mode, -6 dBm output power
		16.0		mA	Receive mode, 1.2 kBaud, register settings optimized for reduced current, input at sensitivity limit
		15.0		mA	Receive mode, 1.2 kBaud, register settings optimized for reduced current, input well above sensitivity limit
		15.7		mA	Receive mode, 38.4 kBaud, register settings optimized for reduced current, input at sensitivity limit
		15.0		mA	Receive mode, 38.4 kBaud, register settings optimized for reduced current, input well above sensitivity limit
		17.1		mA	Receive mode, 250 kBaud, register settings optimized for reduced current, input at sensitivity limit
		15.7		mA	Receive mode, 250 kBaud, register settings optimized for reduced current, input well above sensitivity limit
		29.2		mA	Transmit mode, +10 dBm output power
	16.0		mA	Transmit mode, 0 dBm output power	
	13.1		mA	Transmit mode, -6 dBm output power	

Parameter	Min	Typ	Max	Unit	Condition
Current consumption, 868/915 MHz		15.7		mA	Receive mode, 1.2 kBaud, register settings optimized for reduced current, input at sensitivity limit. See Figure 4-1 through Figure 4-3 for current consumption with register settings optimized for sensitivity.
		14.7		mA	Receive mode, 1.2 kBaud, register settings optimized for reduced current, input well above sensitivity limit. See Figure 4-1 through Figure 4-3 for current consumption with register settings optimized for sensitivity.
		15.6		mA	Receive mode, 38.4 kBaud, register settings optimized for reduced current, input at sensitivity limit. See Figure 4-1 through Figure 4-3 for current consumption with register settings optimized for sensitivity.
		14.6		mA	Receive mode, 38.4 kBaud, register settings optimized for reduced current, input well above sensitivity limit. See Figure 4-1 through Figure 4-3 for current consumption with register settings optimized for sensitivity.
		16.9		mA	Receive mode, 250 kBaud, register settings optimized for reduced current, input at sensitivity limit. See Figure 4-1 through Figure 4-3 for current consumption with register settings optimized for sensitivity.
		15.6		mA	Receive mode, 250 kBaud, register settings optimized for reduced current, input well above sensitivity limit. See Figure 4-1 through Figure 4-3 for current consumption with register settings optimized for sensitivity.
		34.2		mA	Transmit mode, +12 dBm output power, 868 MHz
		30.0		mA	Transmit mode, +10 dBm output power, 868 MHz
		16.8		mA	Transmit mode, 0 dBm output power, 868 MHz
		16.4		mA	Transmit mode, –6 dBm output power, 868 MHz.
		33.4		mA	Transmit mode, +11 dBm output power, 915 MHz
		30.7		mA	Transmit mode, +10 dBm output power, 915 MHz
		17.2		mA	Transmit mode, 0 dBm output power, 915 MHz
	17.0		mA	Transmit mode, –6 dBm output power, 915 MHz	

4.5.1 Typical TX Current Consumption over Temperature and Supply Voltage, 868 MHz

	Supply Voltage VDD = 1.8 V			Supply Voltage VDD = 3.0 V			Supply Voltage VDD = 3.6 V		
	-40	25	85	-40	25	85	-40	25	85
Temperature [°C]	-40	25	85	-40	25	85	-40	25	85
Current [mA], PATABLE=0xC0, +12 dBm	32.7	31.5	30.5	35.3	34.2	33.3	35.5	34.4	33.5
Current [mA], PATABLE=0xC5, +10 dBm	30.1	29.2	28.3	30.9	30.0	29.4	31.1	30.3	29.6
Current [mA], PATABLE=0x50, 0 dBm	16.4	16.0	15.6	17.3	16.8	16.4	17.6	17.1	16.7

4.5.2 Typical TX Current Consumption over Temperature and Supply Voltage, 915 MHz

	Supply Voltage VDD = 1.8 V			Supply Voltage VDD = 3.0 V			Supply Voltage VDD = 3.6 V		
	-40	25	85	-40	25	85	-40	25	85
Temperature [°C]	-40	25	85	-40	25	85	-40	25	85
Current [mA], PATABLE=0xC0, +11 dBm	31.9	30.7	29.8	34.6	33.4	32.5	34.8	33.6	32.7
Current [mA], PATABLE=0xC3, +10 dBm	30.9	29.8	28.9	31.7	30.7	30.0	31.9	31.0	30.2
Current [mA], PATABLE=0x8E, 0 dBm	17.2	16.8	16.4	17.6	17.2	16.9	17.8	17.4	17.1

4.6 Typical RX Current Consumption Over Temperature and Input Power Level, 868 or 915 MHz

See [Section 4.14.1](#).

4.7 RF Receive Section

$T_A = 25^\circ\text{C}$, VDD = 3.0 V if nothing else stated. All measurement results are obtained using [SWRR046](#) and [SWRR045](#).

Parameter	Min	Typ	Max	Unit	Condition
Digital channel filter bandwidth	58		812	kHz	User programmable. The bandwidth limits are proportional to crystal frequency (given values assume a 26.0 MHz crystal)
Spurious emissions		-68	-57	dBm	25 MHz - 1 GHz (Maximum figure is the ETSI EN 300 220 V2.3.1 limit)
		-66	-47	dBm	Above 1 GHz (Maximum figure is the ETSI EN 300 220 V2.3.1 limit) Typical radiated spurious emission is -49 dBm measured at the VCO frequency
RX latency		9		bit	Serial operation. Time from start of reception until data is available on the receiver data output pin is equal to 9 bit
315 MHz					
1.2 kBaud data rate, sensitivity optimized, MDMCFG2.DEM_DCFILT_OFF=0 (2-FSK, 1% packet error rate, 20 bytes packet length, 5.2 kHz deviation, 58 kHz digital channel filter bandwidth)					
Receiver sensitivity		-111		dBm	Sensitivity can be traded for current consumption by setting MDMCFG2.DEM_DCFILT_OFF=1 . The typical current consumption is then reduced from 17.2 mA to 15.4 mA at the sensitivity limit. The sensitivity is typically reduced to -109 dBm
433 MHz					
0.6 kBaud data rate, sensitivity optimized, MDMCFG2.DEM_DCFILT_OFF=0 (GFSK, 1% packet error rate, 20 bytes packet length, 14.3 kHz deviation, 58 kHz digital channel filter bandwidth)					
Receiver sensitivity		-116		dBm	
1.2 kBaud data rate, sensitivity optimized, MDMCFG2.DEM_DCFILT_OFF=0 (GFSK, 1% packet error rate, 20 bytes packet length, 5.2 kHz deviation, 58 kHz digital channel filter bandwidth)					
Receiver sensitivity		-112		dBm	Sensitivity can be traded for current consumption by setting MDMCFG2.DEM_DCFILT_OFF=1 . The typical current consumption is then reduced from 18.0 mA to 16.0 mA at the sensitivity limit. The sensitivity is typically reduced to -110 dBm
38.4 kBaud data rate, sensitivity optimized, MDMCFG2.DEM_DCFILT_OFF=0 (GFSK, 1% packet error rate, 20 bytes packet length, 20 kHz deviation, 100 kHz digital channel filter bandwidth)					
Receiver sensitivity		-104		dBm	

T_A = 25°C, VDD = 3.0 V if nothing else stated. All measurement results are obtained using [SWRR046](#) and [SWRR045](#).

Parameter	Min	Typ	Max	Unit	Condition
250 kBaud data rate, sensitivity optimized, MDMCFG2.DEM_DCFILT_OFF=0 (GFSK, 1% packet error rate, 20 bytes packet length, 127 kHz deviation, 540 kHz digital channel filter bandwidth)					
Receiver sensitivity		-95		dBm	
868/915 MHz					
1.2 kBaud data rate, sensitivity optimized, MDMCFG2.DEM_DCFILT_OFF=0 (GFSK, 1% packet error rate, 20 bytes packet length, 5.2 kHz deviation, 58 kHz digital channel filter bandwidth)					
Receiver sensitivity		-112		dBm	Sensitivity can be traded for current consumption by setting MDMCFG2.DEM_DCFILT_OFF=1 . The typical current consumption is then reduced from 17.7 mA to 15.7 mA at sensitivity limit. The sensitivity is typically reduced to -109 dBm
Saturation		-14		dBm	FIFOTHR.CLOSE_IN_RX=0 . See more in DN010 SWRA147
Adjacent channel rejection ±100 kHz offset		37		dB	Desired channel 3 dB above the sensitivity limit. 100 kHz channel spacing See Figure 4-4 and Figure 4-5 for selectivity performance at other offset frequencies
Image channel rejection		31		dB	IF frequency 152 kHz Desired channel 3 dB above the sensitivity limit
Blocking ±2 MHz offset		-50		dBm	Desired channel 3 dB above the sensitivity limit See Figure 4-4 and Figure 4-5 for blocking performance at other offset frequencies
±10 MHz offset		-40		dBm	
38.4 kBaud data rate, sensitivity optimized, MDMCFG2.DEM_DCFILT_OFF=0 (GFSK, 1% packet error rate, 20 bytes packet length, 20 kHz deviation, 100 kHz digital channel filter bandwidth)					
Receiver sensitivity		-104		dBm	Sensitivity can be traded for current consumption by setting MDMCFG2.DEM_DCFILT_OFF=1 . The typical current consumption is then reduced from 17.7 mA to 15.6 mA at the sensitivity limit. The sensitivity is typically reduced to -102 dBm
Saturation		-16		dBm	FIFOTHR.CLOSE_IN_RX=0 . See more in DN010 SWRA147
Adjacent channel rejection -200 kHz offset		12		dB	Desired channel 3 dB above the sensitivity limit. 200 kHz channel spacing See Figure 4-6 and Figure 4-7 for blocking performance at other offset frequencies
+200 kHz offset		25		dB	
Image channel rejection		23		dB	IF frequency 152 kHz Desired channel 3 dB above the sensitivity limit
Blocking ±2 MHz offset		-50		dBm	Desired channel 3 dB above the sensitivity limit See Figure 4-6 and Figure 4-7 for blocking performance at other offset frequencies
±10 MHz offset		-40		dBm	
250 kBaud data rate, sensitivity optimized, MDMCFG2.DEM_DCFILT_OFF=0 (GFSK, 1% packet error rate, 20 bytes packet length, 127 kHz deviation, 540 kHz digital channel filter bandwidth)					
Receiver sensitivity		-95		dBm	Sensitivity can be traded for current consumption by setting MDMCFG2.DEM_DCFILT_OFF=1 . The typical current consumption is then reduced from 18.9 mA to 16.9 mA at the sensitivity limit. The sensitivity is typically reduced to -91 dBm
Saturation		-17		dBm	FIFOTHR.CLOSE_IN_RX=0 . See more in DN010 SWRA147
Adjacent channel rejection		25		dB	Desired channel 3 dB above the sensitivity limit. 750-kHz channel spacing See Figure 4-8 and Figure 4-9 for blocking performance at other offset frequencies
Image channel rejection		14		dB	IF frequency 304 kHz Desired channel 3 dB above the sensitivity limit
Blocking					Desired channel 3 dB above the sensitivity limit See Figure 4-8 and Figure 4-9 for blocking performance at other offset frequencies

4.7.1 Typical Sensitivity over Temperature and Supply Voltage, 868 MHz, Sensitivity Optimized Setting

	Supply Voltage VDD = 1.8 V			Supply Voltage VDD = 3.0 V			Supply Voltage VDD = 3.6 V		
	-40	25	85	-40	25	85	-40	25	85
Temperature [°C]	-40	25	85	-40	25	85	-40	25	85
Sensitivity [dBm] 1.2 kBaud	-113	-112	-110	-113	-112	-110	-113	-112	-110
Sensitivity [dBm] 38.4 kBaud	-105	-104	-102	-105	-104	-102	-105	-104	-102
Sensitivity [dBm] 250 kBaud	-97	-96	-92	-97	-95	-92	-97	-94	-92

4.7.2 Typical Sensitivity over Temperature and Supply Voltage, 915 MHz, Sensitivity Optimized Setting

	Supply Voltage VDD = 1.8 V			Supply Voltage VDD = 3.0 V			Supply Voltage VDD = 3.6 V		
	-40	25	85	-40	25	85	-40	25	85
Temperature [°C]	-40	25	85	-40	25	85	-40	25	85
Sensitivity [dBm] 1.2 kBaud	-113	-112	-110	-113	-112	-110	-113	-112	-110
Sensitivity [dBm] 38.4 kBaud	-105	-104	-102	-104	-104	-102	-105	-104	-102
Sensitivity [dBm] 250 kBaud	-97	-94	-92	-97	-95	-92	-97	-95	-92

4.7.3 Blocking and Selectivity

See [Section 4.14.2](#).

4.8 RF Transmit Section

$T_A = 25^\circ\text{C}$, VDD = 3.0 V, +10 dBm if nothing else stated. All measurement results are obtained using [SWRR046](#) and [SWRR045](#).

Parameter	Min	Typ	Max	Unit	Condition
Differential load impedance					
315 MHz		122 + j31		Ω	Differential impedance as seen from the RF-port (RF_P and RF_N) towards the antenna.
433 MHz		116 + j41		Ω	
868/915 MHz		86.5 + j43		Ω	
Output power, highest setting					Output power is programmable, and full range is available in all frequency bands. Output power may be restricted by regulatory limits. See Design Note DN013 SWRA168 for output power and harmonics figures when using multi-layer inductors. The output power is then typically +10 dBm when operating at 868/915 MHz. Delivered to a 50- Ω single-ended load through the RF matching network in SWRR046 and SWRR045
315 MHz		+10		dBm	
433 MHz		+10		dBm	
868 MHz		+12		dBm	
915 MHz		+11		dBm	
Output power, lowest setting		-30		dBm	Output power is programmable, and full range is available in all frequency bands. Delivered to a 50- Ω single-ended load through the RF matching network in SWRR046 and SWRR045 Measured on SWRR046 and SWRR045 with CW, maximum output power The antennas used during the radiated measurements (SMAFF-433 from R.W. Badland and Nearson S331 868/915) play a part in attenuating the harmonics Note: All harmonics are below -41.2 dBm when operating in the 902 - 928 MHz band
Harmonics, radiated					
2nd Harm, 433 MHz		-49		dBm	
3rd Harm, 433 MHz		-40		dBm	
2nd Harm, 868 MHz		-47		dBm	
3rd Harm, 868 MHz		-55		dBm	
2nd Harm, 915 MHz		-50		dBm	
3rd Harm, 915 MHz		-54		dBm	
Harmonics, conducted					Measured with +10 dBm CW at 315 MHz and 433 MHz
315 MHz		< -35		dBm	
		< -53		dBm	Frequencies above 960 MHz

$T_A = 25^\circ\text{C}$, $V_{DD} = 3.0\text{ V}$, +10 dBm if nothing else stated. All measurement results are obtained using [SWRR046](#) and [SWRR045](#).

Parameter	Min	Typ	Max	Unit	Condition
433 MHz		-43		dBm	Frequencies below 1 GHz
		< -45		dBm	Frequencies above 1 GHz
868 MHz 2nd Harm other harmonics		-36		dBm	Measured with +12 dBm CW at 868 MHz
		< -46		dBm	
915 MHz 2nd Harm other harmonics		-34		dBm	Measured with +11 dBm CW at 915 MHz (requirement is -20 dBc under FCC 15.247)
		< -50		dBm	
Spurious emissions conducted, harmonics not included					Measured with +10 dBm CW at 315 MHz and 433 MHz
315 MHz		< -58			Frequencies below 960 MHz
		< -53			Frequencies above 960 MHz
433 MHz		< -50			Frequencies below 1 GHz
		< -54			Frequencies above 1 GHz
		< -56			Frequencies within 47-74, 87.5-118, 174-230, 470-862 MHz
					Measured with +12 dBm CW at 868 MHz
868 MHz		< -50			Frequencies below 1 GHz
		< -52			Frequencies above 1 GHz
		< -53			Frequencies within 47-74, 87.5-118, 174-230, 470-862 MHz
					All radiated spurious emissions are within the limits of ETSI. The peak conducted spurious emission is -53 dBm at 699 MHz (868 MHz - 169 MHz), which is in a frequency band limited to -54 dBm by EN 300 220 V2.3.1. An alternative filter can be used to reduce the emission at 699 MHz below -54 dBm, for conducted measurements, and is shown in Figure 6-2 . See more information in DN017 SWRA168 .
					For compliance with modulation bandwidth requirements under EN 300 220 V2.3.1 in the 863 to 870 MHz frequency range it is recommended to use a 26 MHz crystal for frequencies below 869 MHz and a 27 MHz crystal for frequencies above 869 MHz.
					Measured with +11 dBm CW at 915 MHz
915 MHz		< -51			Frequencies below 960 MHz
		< -54			Frequencies above 960 MHz
TX latency		8		bit	Serial operation. Time from sampling the data on the transmitter data input pin until it is observed on the RF output ports

4.8.1 Typical Variation in Output Power over Temperature and Supply Voltage, 868 MHz

	Supply Voltage VDD = 1.8 V			Supply Voltage VDD = 3.0 V			Supply Voltage VDD = 3.6 V

RF carrier phase noise		-113		dBc/Hz	at 2 MHz offset from carrier
RF carrier phase noise		-119		dBc/Hz	at 5 MHz offset from carrier
RF carrier phase noise		-129		dBc/Hz	at 10 MHz offset from carrier
PLL turn-on or hop time (See Table 5-11)	72	75	75	μs	Time from leaving the IDLE state until arriving in the RX, FSTXON, or TX state, when not performing calibration. Crystal oscillator running.
PLL RX/TX settling time (See Table 5-11)	29	30	30	μs	Settling time for the $1\times\text{IF}$ frequency step from RX to TX
PLL TX/RX settling time (See Table 5-11)	30	31	31	μs	Settling time for the $1\times\text{IF}$ frequency step from TX to RX. 250 kbps data rate.
PLL calibration time (See Table 5-12)	685	712	724	μs	Calibration can be initiated manually or automatically before entering or after leaving RX/TX

4.11 DC Characteristics

$T_A = 25^\circ\text{C}$ if nothing else stated.

Digital Inputs/Outputs	Min	Max	Unit	Condition
Logic "0" input voltage	0	0.7	V	
Logic "1" input voltage	$V_{DD} - 0.7$	V_{DD}	V	
Logic "0" output voltage	0	0.5	V	For up to 4 mA output current
Logic "1" output voltage	$V_{DD} - 0.3$	V_{DD}	V	For up to 4 mA output current
Logic "0" input current	N/A	-50	nA	Input equals 0 V
Logic "1" input current	N/A	50	nA	Input equals V_{DD}

4.12 Power-On Reset

For proper Power-On-Reset functionality the power supply should comply with the requirements in [Section 4.12](#). Otherwise, the chip should be assumed to have unknown state until transmitting an SRES strobe over the SPI interface. See [Section 5.19.1](#), *Power-On Start-Up Sequence*, for further details.

Parameter	Min	Typ	Max	Unit	Condition
Power-up ramp-up time			5	ms	From 0 V until reaching 1.8 V
Power off time	1			ms	Minimum time between power-on and power-off

4.13 Thermal Characteristics

NAME	DESCRIPTION	QFN (°C/W)
R _{θJA}	Junction-to-ambient thermal resistance	47

5 Detailed Description

5.1 Overview

CC110L features a low-IF receiver. The received RF signal is amplified by the low-noise amplifier (LNA) and down-converted in quadrature (I and Q) to the intermediate frequency (IF). At IF, the I/Q signals are digitized by the ADCs. Automatic gain control (AGC), fine channel filtering, demodulation, and bit/packet synchronization are performed digitally.

The transmitter part of CC110L is based on direct synthesis of the RF frequency. The frequency synthesizer includes a completely on-chip LC VCO and a 90-degree phase shifter for generating the I and Q LO signals to the down-conversion mixers in receive mode.

A crystal is to be connected to XOSC_Q1 and XOSC_Q2. The crystal oscillator generates the reference frequency for the synthesizer, as well as clocks for the ADC and the digital part.

A 4-wire SPI is used for configuration and data buffer access.

The digital baseband includes support for channel configuration, packet handling, and data buffering.

5.2 Functional Block Diagram

A simplified block diagram of CC110L is shown in [Figure 5-1](#).

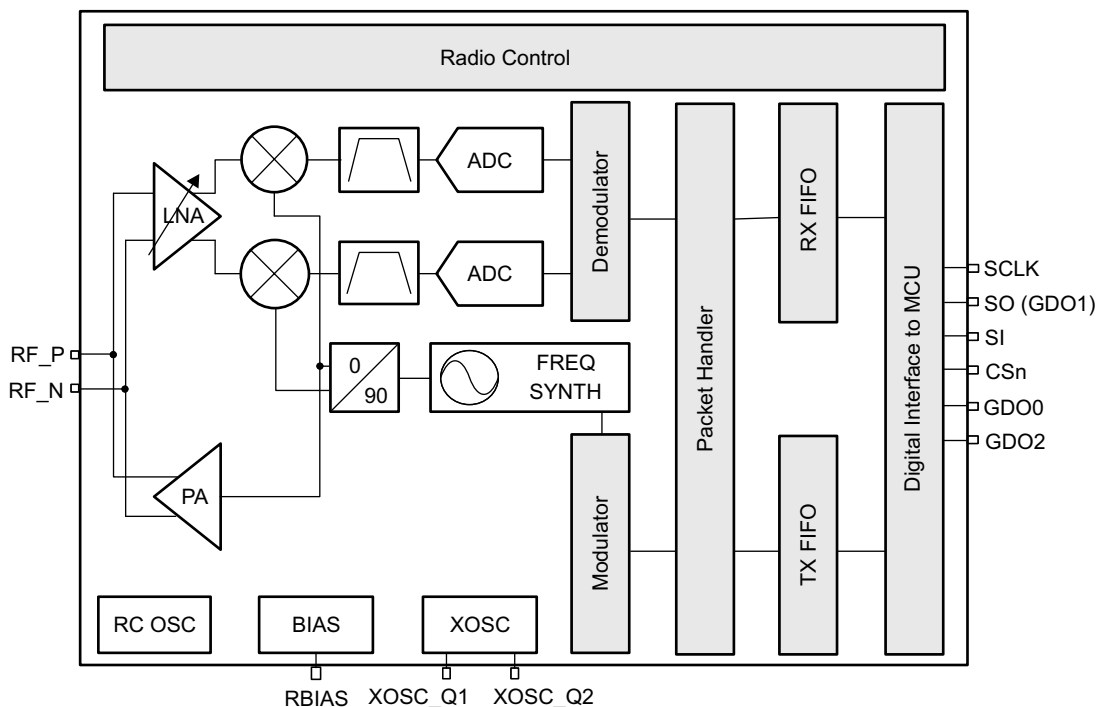

Figure 5-1. CC110L Simplified Block Diagram

5.3 Configuration Overview

CC110L can be configured to achieve optimum performance for many different applications. Configuration is done using the SPI interface. See [Section 5.5](#) for more description of the SPI interface. The following key parameters can be programmed:

- Power-down / power up mode
- Crystal oscillator power-up / power-down
- Receive / transmit mode
- Carrier frequency / RF channel
- Data rate
- Modulation format
- RX channel filter bandwidth
- RF output power
- Data buffering with separate 64-byte RX and TX FIFOs
- Packet radio hardware support

Details of each configuration register can be found in [Section 5.28](#).

[Figure 5-2](#) shows a simplified state diagram that explains the main CC110L states together with typical usage and current consumption. For detailed information on controlling the CC110L state machine, and a complete state diagram, see [Section 5.19](#).

Figure 5-2. Simplified Radio Control State Diagram, with Typical Current Consumption at 1.2 kBaud Data Rate and MDMCFG2.DEM_DCFILT_OFF=1 (current optimized) – Frequency Band = 868 MHz

5.4 Configuration Software

CC110L can be configured using the SmartRF™ Studio software [SWRC176](#). The SmartRF Studio software is highly recommended for obtaining optimum register settings, and for evaluating performance and functionality.

After chip reset, all the registers have default values as shown [Section 5.28](#).

The optimum register setting might differ from the default value. After a reset all registers that shall be different from the default value therefore needs to be programmed through the SPI interface.

5.5 4-wire Serial Configuration and Data Interface

CC110L is configured through a simple 4-wire SPI-compatible interface (SI, SO, SCLK and CSn) where CC110L is the slave. This interface is also used to read and write buffered data. All transfers on the SPI interface are done most significant bit first.

All transactions on the SPI interface start with a header byte containing a R \overline{W} bit, a burst access bit (B), and a 6-bit address (A5–A0).

The CSn pin must be kept low during transfers on the SPI bus. If CSn goes high during the transfer of a header byte or during read/write from/to a register, the transfer will be cancelled. The timing for the address and data transfer on the SPI interface is shown in Figure 5-3 with reference to Table 5-1.

When CSn is pulled low, the MCU must wait until CC110L SO pin goes low before starting to transfer the header byte. This indicates that the crystal is running. Unless the chip was in the SLEEP or XOFF states, the SO pin will always go low immediately after taking CSn low.

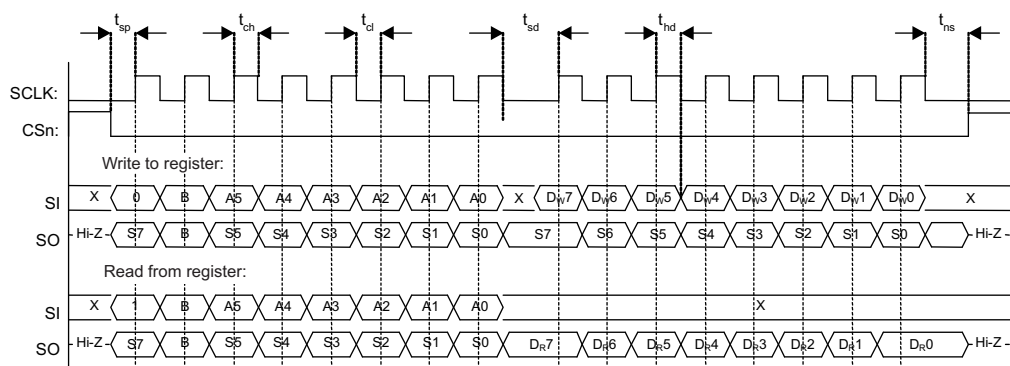

Figure 5-3. Configuration Registers Write and Read Operations

Table 5-1. SPI Interface Timing Requirements

Parameter	Description	Min	Max	Units	
f _{SCLK}	SCLK frequency		10	MHz	
	100 ns delay inserted between address byte and data byte (single access), or between address and data, and between each data byte (burst access).	–			
	SCLK frequency, single access	–	9		
	No delay between address and data byte				
	SCLK frequency, burst access	–	6.5		
t _{sp,pd}	CSn low to positive edge on SCLK, in power-down mode	150	–	μs	
t _{sp}	CSn low to positive edge on SCLK, in active mode	20	–	ns	
t _{ch}	Clock high	50	–	ns	
t _{cl}	Clock low	50	–	ns	
t _{rise}	Clock rise time	–	40	ns	
t _{fall}	Clock fall time	–	40	ns	
t _{sd}	Setup data (negative SCLK edge) to positive edge on SCLK (tsd applies between address and data bytes, and between data bytes)	Single access	55	–	ns
		Burst access	76	–	
t _{hd}	Hold data after positive edge on SCLK	20	–	ns	
t _{ns}	Negative edge on SCLK to CSn high.	20	–	ns	

NOTE

The minimum $t_{sp,pd}$ figure in [Table 5-1](#) can be used in cases where the user does not read the **CHIP_RDYn** signal. CSn low to positive edge on SCLK when the chip is woken from power-down depends on the start-up time of the crystal being used. The 150 μ s in [Table 5-1](#) is the crystal oscillator start-up time measured on [SWRR046](#) and [SWRR045](#) using crystal AT-41CD2 from NDK.

5.6 Chip Status Byte

When the header byte, data byte, or command strobe is sent on the SPI interface, the chip status byte is sent by the CC110L on the SO pin. The status byte contains key status signals, useful for the MCU. The first bit, s7, is the **CHIP_RDYn** signal and this signal must go low before the first positive edge of SCLK. The **CHIP_RDYn** signal indicates that the crystal is running.

Bits 6, 5, and 4 comprise the **STATE** value. This value reflects the state of the chip. The XOSC and power to the digital core are on in the IDLE state, but all other modules are in power down. The frequency and channel configuration should only be updated when the chip is in this state. The RX state will be active when the chip is in receive mode. Likewise, TX is active when the chip is transmitting.

The last four bits (3:0) in the status byte contains **FIFO_BYTES_AVAILABLE**. For read operations (the R/\bar{W} bit in the header byte is set to 1), the **FIFO_BYTES_AVAILABLE** field contains the number of bytes available for reading from the RX FIFO. For write operations (the R/\bar{W} bit in the header byte is set to 0), the **FIFO_BYTES_AVAILABLE** field contains the number of bytes that can be written to the TX FIFO. When **FIFO_BYTES_AVAILABLE**=15, 15 or more bytes are available/free.

[Table 5-2](#) gives a status byte summary.

Table 5-2. Status Byte Summary

Bits	Name	Description		
7	CHIP_RDYn	Stays high until power and crystal have stabilized. Should always be low when using the SPI interface.		
6:4	STATE[2:0]	Indicates the current main state machine mode		
		Value	State	Description
		000	IDLE	IDLE state (Also reported for some transitional states instead of SETTLING or CALIBRATE)
		001	RX	Receive mode
		010	TX	Transmit mode
		011	FSTXON	Fast TX ready
		100	CALIBRATE	Frequency synthesizer calibration is running
		101	SETTLING	PLL is settling
		110	RXFIFO_OVERFLOW	RX FIFO has overflowed. Read out any useful data, then flush the FIFO with SFRX
111	TXFIFO_UNDERFLOW	TX FIFO has underflowed. Acknowledge with SFTX		
3:0	FIFO_BYTES_AVAILABLE[3:0]	The number of bytes available in the RX FIFO or free bytes in the TX FIFO		

5.7 Register Access

The configuration registers on the CC110L are located on SPI addresses from 0x00 to 0x2E. [Table 5-20](#) lists all configuration registers. It is highly recommended to use SmartRF Studio [SWRC176](#) to generate optimum register settings. The detailed description of each register is found in [Section 5.28.1](#) and [Section 5.28.2](#). All configuration registers can be both written to and read. The R/W bit controls if the register should be written to or read. When writing to registers, the status byte is sent on the SO pin each time a header byte or data byte is transmitted on the SI pin. When reading from registers, the status byte is sent on the SO pin each time a header byte is transmitted on the SI pin.

Registers with consecutive addresses can be accessed in an efficient way by setting the burst bit (B) in the header byte. The address bits (A5 - A0) set the start address in an internal address counter. This counter is incremented by one each new byte (every 8 clock pulses). The burst access is either a read or a write access and must be terminated by setting CSn high.

For register addresses in the range 0x30 - 0x3D, the burst bit is used to select between status registers when burst bit is one, and between command strobes when burst bit is zero (see [Section 5.8](#)). Because of this, burst access is not available for status registers and they must be accessed one at a time. The status registers can only be read.

5.8 SPI Read

When reading register fields over the SPI interface while the register fields are updated by the radio hardware (that is, [MARCSTATE](#) or [TXBYTES](#)), there is a small, but finite, probability that a single read from the register is being corrupt. As an example, the probability of any single read from [TXBYTES](#) being corrupt, assuming the maximum data rate is used, is approximately 80 ppm. Refer to the CC110L Errata Notes [SWRZ037](#) for more details.

5.9 Command Strokes

Command Strokes may be viewed as single byte instructions to CC110L. By addressing a command strobe register, internal sequences will be started. These commands are used to disable the crystal oscillator, enable receive mode, enable calibration etc. The 11 command strobes are listed in [Table 5-19](#).

NOTE

An SIDLE strobe will clear all pending command strobes until IDLE state is reached. This means that if for example an SIDLE strobe is issued while the radio is in RX state, any other command strobes issued before the radio reaches IDLE state will be ignored.

The command strobe registers are accessed by transferring a single header byte (no data is being transferred). That is, only the R/W bit, the burst access bit (set to 0), and the six address bits (in the range 0x30 through 0x3D) are written. The R/W bit can be either one or zero and will determine how the [FIFO_BYTES_AVAILABLE](#) field in the status byte should be interpreted.

When writing command strobes, the status byte is sent on the SO pin.

A command strobe may be followed by any other SPI access without pulling CSn high. However, if an SRES strobe is being issued, one will have to wait for SO to go low again before the next header byte can be issued as shown in [Figure 5-4](#). The command strobes are executed immediately, with the exception of the SPWD and the SXOFF strobes, which are executed when CSn goes high.

Figure 5-4. SRES Command Strobe

5.10 FIFO Access

The 64-byte TX FIFO and the 64-byte RX FIFO are accessed through the 0x3F address. When the R/W bit is zero, the TX FIFO is accessed, and the RX FIFO is accessed when the R/W bit is one.

The TX FIFO is write-only, while the RX FIFO is read-only.

The burst bit is used to determine if the FIFO access is a single byte access or a burst access. The single byte access method expects a header byte with the burst bit set to zero and one data byte. After the data byte, a new header byte is expected; hence, CSn can remain low. The burst access method expects one header byte and then consecutive data bytes until terminating the access by setting CSn high.

The following header bytes access the FIFOs:

- 0x3F: Single byte access to TX FIFO
- 0x7F: Burst access to TX FIFO
- 0xBF: Single byte access to RX FIFO
- 0xFF: Burst access to RX FIFO

When writing to the TX FIFO, the status byte (see Section 5.6) is output on SO for each new data byte as shown in Figure 5-3. This status byte can be used to detect TX FIFO underflow while writing data to the TX FIFO. Note that the status byte contains the number of bytes free before writing the byte in progress to the TX FIFO. When the last byte that fits in the TX FIFO is transmitted on SI, the status byte received concurrently on SO will indicate that one byte is free in the TX FIFO. The TX FIFO may be flushed by issuing a SFTX command strobe. Similarly, a SFRX command strobe will flush the RX FIFO. A SFTX or SFRX command strobe can only be issued in the IDLE, TXFIFO_UNDERFLOW, or RXFIFO_OVERFLOW states. Both FIFOs are flushed when going to the SLEEP state.

Figure 5-5 gives a brief overview of different register access types possible.

5.11 PATABLE Access

The 0x3E address is used to access the PATABLE, which is used for selecting PA power control settings. The SPI expects one or two data bytes after receiving the address (the burst bit must be set if two bytes are to be written). For OOK, two bytes should be written to PATABLE; the first byte after the address will set the logic 0 power level and the second byte written will set the logic 1 power level. For all other modulations formats, only one byte should be written to PATABLE. Use SmartRF Studio SWRC176 or DN013 SWRA168 for recommended register values for a given output power.

The PATABLE can also be read by setting the R/W bit to 1. The read operation can be done as a single byte or burst access, depending on how many bytes should be read (one or two). Note that pulling CSn high will reset the index counter to zero, meaning that burst access needs to be used for reading/writing the second PATABLE entry. For the same reason, if one byte is written to the PATABLE and this value is to be read out, CSn must be set high before the read access in order to set the index counter back to zero.

The content of the PATABLE is lost when entering the SLEEP state, except for the first byte, meaning that if OOK is used, the PATABLE needs to be reprogrammed when waking up from SLEEP.

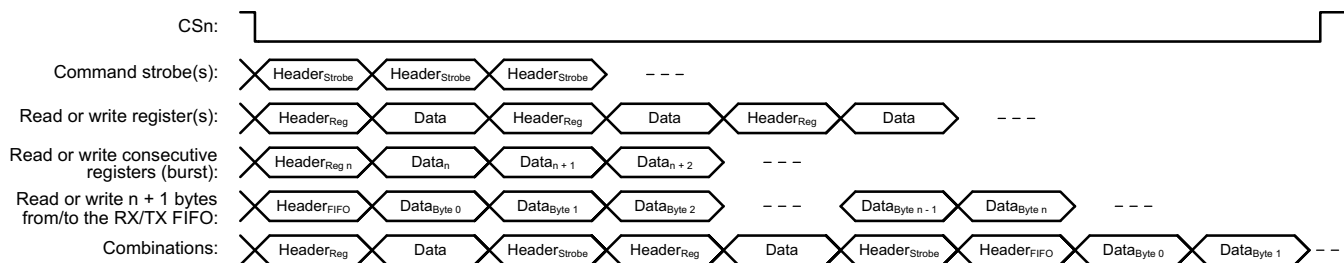

Figure 5-5. Register Access Types

5.12 Microcontroller Interface and Pin Configuration

In a typical system, CC110L will interface to a microcontroller. This microcontroller must be able to:

- Program CC110L into different modes
- Read and write buffered data
- Read back status information through the 4-wire SPI-bus configuration interface (SI, SO, SCLK and CSn)

5.12.1 Configuration Interface

The microcontroller uses four I/O pins for the SPI configuration interface (SI, SO, SCLK and CSn). The SPI is described in [Section 5.5](#).

5.12.2 General Control and Status Pins

The CC110L has two dedicated configurable pins (GDO0 and GDO2) and one shared pin (GDO1) that can output internal status information useful for control software. These pins can be used to generate interrupts on the MCU. See [Section 5.25](#) for more details on the signals that can be programmed.

GDO1 is shared with the SO pin in the SPI interface. The default setting for GDO1/SO is 3-state output. By selecting any other of the programming options, the GDO1/SO pin will become a generic pin. When CSn is low, the pin will always function as a normal SO pin.

In the synchronous and asynchronous serial modes, the GDO0 pin is used as a serial TX data input pin while in transmit mode.

5.13 Data Rate Programming

The data rate used when transmitting, or the data rate expected in receive is programmed by the [MDMCFG3.DRATE_M](#) and the [MDMCFG4.DRATE_E](#) configuration registers. The data rate is given by the formula below. As the formula shows, the programmed data rate depends on the crystal frequency.

$$R_{\text{DATA}} = \frac{(256 + \text{DRATE_M}) \cdot 2^{\text{DRATE_E}}}{2^{28}} \cdot f_{\text{XOSC}} \quad (1)$$

The following approach can be used to find suitable values for a given data rate:

$$\text{DRATE_E} = \log_2 \left(\frac{R_{\text{DATA}} \cdot 2^{20}}{f_{\text{XOSC}}} \right) \quad (2)$$

$$\text{DRATE_M} = \frac{R_{\text{DATA}} \cdot 2^{28}}{f_{\text{XOSC}} \cdot 2^{\text{DRATE_E}}} - 256 \quad (3)$$

If `DRATE_M` is rounded to the nearest integer and becomes 256, increment `DRATE_E` and use `DRATE_M = 0`.

The data rate can be set from 0.6 kBaud to 500 kBaud with the minimum step size according to [Table 5-3](#). See [Section 4.4](#) for the minimum and maximum data rates for the different modulation formats.

Table 5-3. Data Rate Step Size (Assuming a 26-MHz Crystal)

Min Data Rate [kBaud]	Typical Data Rate [kBaud]	Max Data Rate [kBaud]	Data rate Step Size [kBaud]
0.6	1.0	0.79	0.0015
0.79	1.2	1.58	0.0031
1.59	2.4	3.17	0.0062
3.17	4.8	6.33	0.0124
6.35	9.6	12.7	0.0248
12.7	19.6	25.3	0.0496
25.4	38.4	50.7	0.0992
50.8	76.8	101.4	0.1984
101.6	153.6	202.8	0.3967
203.1	250	405.5	0.7935
406.3	500	500	1.5869

5.14 Receiver Channel Filter Bandwidth

In order to meet different channel width requirements, the receiver channel filter is programmable. The [MDMCFG4.CHANBW_E](#) and [MDMCFG4.CHANBW_M](#) configuration registers control the receiver channel filter bandwidth, which scales with the crystal oscillator frequency.

The following formula gives the relation between the register settings and the channel filter bandwidth:

$$BW_{\text{channel}} = \frac{f_{\text{XOSC}}}{8 \cdot (4 + \text{CHANBW_M}) \cdot 2^{\text{CHANBW_E}}} \quad (4)$$

[Table 5-4](#) lists the channel filter bandwidths supported by the CC110L.

Table 5-4. Channel Filter Bandwidths [kHz] (Assuming a 26-MHz Crystal)

MDMCFG4.CHANBW_M	MDMCFG4.CHANBW_E			
	00	01	10	11
00	812	406	203	102
01	650	325	162	81
10	541	270	135	68
11	464	232	116	58

For best performance, the channel filter bandwidth should be selected so that the signal bandwidth occupies at most 80% of the channel filter bandwidth. The channel center tolerance due to crystal inaccuracy should also be subtracted from the channel filter bandwidth. The following example illustrates this:

With the channel filter bandwidth set to 500 kHz, the signal should stay within 80% of 500 kHz, which is 400 kHz. Assuming 915 MHz frequency and ± 20 ppm frequency uncertainty for both the transmitting device and the receiving device, the total frequency uncertainty is ± 40 ppm of 915 MHz, which is ± 37 kHz. If the whole transmitted signal bandwidth is to be received within 400 kHz, the transmitted signal bandwidth should be maximum 400 kHz – 2×37 kHz, which is 326 kHz. By compensating for a frequency offset between the transmitter and the receiver, the filter bandwidth can be reduced and the sensitivity can be improved, see more in DN005 [SWRA122](#) and in [Section 5.15.1](#).

5.15 Demodulator, Symbol Synchronizer, and Data Decision

CC110L contains an advanced and highly configurable demodulator. Channel filtering and frequency offset compensation is performed digitally. To generate the RSSI level (see [Section 5.18.2](#) for more information), the signal level in the channel is estimated. Data filtering is also included for enhanced performance.

5.15.1 Frequency Offset Compensation

The CC110L has a very fine frequency resolution (see [Section 4.10](#)). This feature can be used to compensate for frequency offset and drift.

When using 2-FSK, GFSK, or 4-FSK modulation, the demodulator will compensate for the offset between the transmitter and receiver frequency within certain limits, by estimating the center of the received data. The frequency offset compensation configuration is controlled from the [FOCCFG](#) register. By compensating for a large frequency offset between the transmitter and the receiver, the sensitivity can be improved, see DN005 [SWRA122](#).

The tracking range of the algorithm is selectable as fractions of the channel bandwidth with the [FOCCFG.FOC_LIMIT](#) configuration register.

If the [FOCCFG.FOC_BS_CS_GATE](#) bit is set, the offset compensator will freeze until carrier sense asserts. This may be useful when the radio is in RX for long periods with no traffic, since the algorithm may drift to the boundaries when trying to track noise.

The tracking loop has two gain factors, which affects the settling time and noise sensitivity of the algorithm. [FOCCFG.FOC_PRE_K](#) sets the gain before the sync word is detected, and [FOCCFG.FOC_POST_K](#) selects the gain after the sync word has been found

NOTE

Frequency offset compensation is not supported for OOK modulation.

The estimated frequency offset value is available in the [FREQUEST](#) status register. This can be used for permanent frequency offset compensation. By writing the value from [FREQUEST](#) into [FSCTRL0.FREQOFF](#), the frequency synthesizer will automatically be adjusted according to the estimated frequency offset. More details regarding this permanent frequency compensation algorithm can be found in DN015 [SWRA159](#).

5.15.2 Bit Synchronization

The bit synchronization algorithm extracts the clock from the incoming symbols. The algorithm requires that the expected data rate is programmed as described in [Section 5.13](#). Re-synchronization is performed continuously to adjust for error in the incoming symbol rate.

5.15.3 Byte Synchronization

Byte synchronization is achieved by a continuous sync word search. The sync word is a 16 bit configurable field (can be repeated to get a 32 bit) that is automatically inserted at the start of the packet by the modulator in transmit mode. The MSB in the sync word is sent first. The demodulator uses this field to find the byte boundaries in the stream of bits. The sync word will also function as a system identifier, since only packets with the correct predefined sync word will be received if the sync word detection in RX is enabled in register [MDMCFG2](#) (see [Section 5.18.1](#)). The sync word detector correlates against the user-configured 16 or 32 bit sync word. The correlation threshold can be set to 15/16, 16/16, or 30/32 bits match. The sync word can be further qualified using the preamble quality indicator mechanism described below and/or a carrier sense condition. The sync word is configured through the [SYNC1](#) and [SYNC0](#) registers.

5.16 Packet Handling Hardware Support

The CC110L has built-in hardware support for packet oriented radio protocols. In transmit mode, the packet handler can be configured to add the following elements to the packet stored in the TX FIFO:

- A programmable number of preamble bytes
- A two byte synchronization (sync) word. Can be duplicated to give a 4-byte sync word (recommended). It is not possible to only insert preamble or only insert a sync word
- A CRC checksum computed over the data field.
- The recommended setting is 4-byte preamble and 4-byte sync word, except for 500 kBaud data rate where the recommended preamble length is 8 bytes.

In receive mode, the packet handling support will de-construct the data packet by implementing the following (if enabled):

- Preamble detection
- Sync word detection
- CRC computation and CRC check
- One byte address check
- Packet length check (length byte checked against a programmable maximum length)

Optionally, two status bytes (see [Table 5-5](#) and [Table 5-6](#)) with RSSI value and CRC status can be appended in the RX FIFO.

Table 5-5. Received Packet Status Byte 1 (First Byte Appended After the Data)

Bit	Field Name	Description
7:0	RSSI	RSSI value

Table 5-6. Received Packet Status Byte 2 (Second Byte Appended After the Data)

Bit	Field Name	Description
7	CRC_OK	1: CRC for received data OK (or CRC disabled) 0: CRC error in received data
6:0	Reserved	

NOTE

Register fields that control the packet handling features should only be altered when CC110L is in the IDLE state.

5.16.1 Packet Format

The format of the data packet can be configured and consists of the following items (see [Figure 5-6](#)):

- Preamble
- Synchronization word
- Optional length byte
- Optional address byte
- Payload
- Optional 2 byte CRC

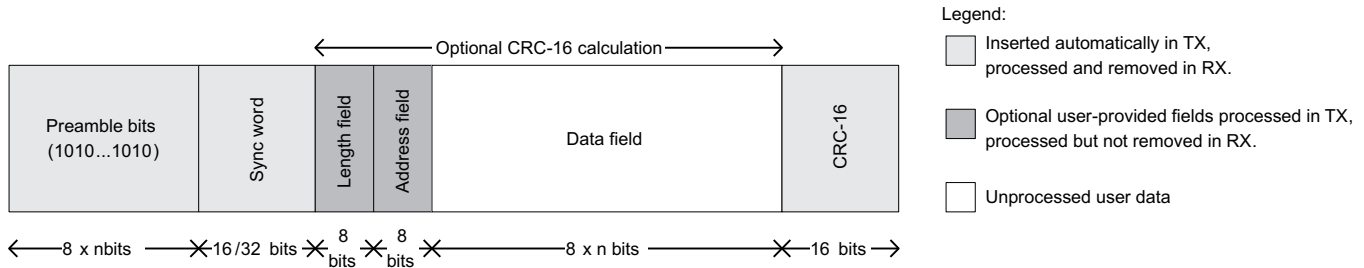

Figure 5-6. Packet Format

The preamble pattern is an alternating sequence of ones and zeros (10101010...). The minimum length of the preamble is programmable through the value of [MDMCFG1.NUM_PREAMBLE](#). When enabling TX, the modulator will start transmitting the preamble. When the programmed number of preamble bytes has been transmitted, the modulator will send the sync word and then data from the TX FIFO if data is available. If the TX FIFO is empty, the modulator will continue to send preamble bytes until the first byte is written to the TX FIFO. The modulator will then send the sync word and then the data bytes.

The synchronization word is a two-byte value set in the [SYNC1](#) and [SYNC0](#) registers. The sync word provides byte synchronization of the incoming packet. A one-byte sync word can be emulated by setting the [SYNC1](#) value to the preamble pattern. It is also possible to emulate a 32 bit sync word by setting [MDMCFG2.SYNC_MODE](#) to 3 or 7. The sync word will then be repeated twice.

CC110L supports both constant packet length protocols and variable length protocols. Variable or fixed packet length mode can be used for packets up to 255 bytes. For longer packets, infinite packet length mode must be used.

Fixed packet length mode is selected by setting [PKTCTRL0.LENGTH_CONFIG=0](#). The desired packet length is set by the [PKTLEN](#) register. This value must be different from 0.

In variable packet length mode, [PKTCTRL0.LENGTH_CONFIG=1](#), the packet length is configured by the first byte after the sync word. The packet length is defined as the payload data, excluding the length byte and the optional CRC. The [PKTLEN](#) register is used to set the maximum packet length allowed in RX. Any packet received with a length byte with a value greater than [PKTLEN](#) will be discarded. The [PKTLEN](#) value must be different from 0.

With [PKTCTRL0.LENGTH_CONFIG=2](#), the packet length is set to infinite and transmission and reception will continue until turned off manually. As described in [Section 5.16.1.1](#), this can be used to support packet formats with different length configuration than natively supported by CC110L. One should make sure that TX mode is not turned off during the transmission of the first half of any byte. Refer to the CC110L Errata Notes [SWRZ037](#) for more details.

NOTE

The minimum packet length supported (excluding the optional length byte and CRC) is one byte of payload data.

5.16.1.1 Arbitrary Length Field Configuration

The packet length register, [PKTLEN](#), can be reprogrammed during receive and transmit. In combination with fixed packet length mode ([PKTCTRL0.LENGTH_CONFIG=0](#)), this opens the possibility to have a different length field configuration than supported for variable length packets (in variable packet length mode the length byte is the first byte after the sync word). At the start of reception, the packet length is set to a large value. The MCU reads out enough bytes to interpret the length field in the packet. Then the [PKTLEN](#) value is set according to this value. The end of packet will occur when the byte counter in the packet handler is equal to the [PKTLEN](#) register. Thus, the MCU must be able to program the correct length, before the internal counter reaches the packet length.

5.16.1.2 Packet Length > 255

The packet automation control register, `PKTCTRL0`, can be reprogrammed during TX and RX. This opens the possibility to transmit and receive packets that are longer than 256 bytes and still be able to use the packet handling hardware support. At the start of the packet, the infinite packet length mode (`PKTCTRL0.LENGTH_CONFIG=2`) must be active. On the TX side, the `PKTLEN` register is set to $\text{mod}(\text{length}, 256)$. On the RX side the MCU reads out enough bytes to interpret the length field in the packet and sets the `PKTLEN` register to $\text{mod}(\text{length}, 256)$. When less than 256 bytes remains of the packet, the MCU disables infinite packet length mode and activates fixed packet length mode (`PKTCTRL0.LENGTH_CONFIG=0`). When the internal byte counter reaches the `PKTLEN` value, the transmission or reception ends (the radio enters the state determined by `TXOFF_MODE` or `RXOFF_MODE`). Automatic CRC appending/checking can also be used (by setting `PKTCTRL0.CRC_EN=1`).

When for example a 600-byte packet is to be transmitted, the MCU should do the following (see Figure 5-7).

- Set `PKTCTRL0.LENGTH_CONFIG=2`.
- Pre-program the `PKTLEN` register to $\text{mod}(600, 256) = 88$.
- Transmit at least 345 bytes (600 - 255), for example by filling the 64-byte TX FIFO six times (384 bytes transmitted).
- Set `PKTCTRL0.LENGTH_CONFIG=0`.
- The transmission ends when the packet counter reaches 88. A total of 600 bytes are transmitted.

Figure 5-7. Packet Length > 255

5.16.2 Packet Filtering in Receive Mode

CC110L supports three different types of packet-filtering; address filtering, maximum length filtering, and CRC filtering.

5.16.2.1 Address Filtering

Setting `PKTCTRL1.ADR_CHK` to any other value than zero enables the packet address filter. The packet handler engine will compare the destination address byte in the packet with the programmed node address in the `ADDR` register and the 0x00 broadcast address when `PKTCTRL1.ADR_CHK=10` or both the 0x00 and 0xFF broadcast addresses when `PKTCTRL1.ADR_CHK=11`. If the received address matches a valid address, the packet is received and written into the RX FIFO. If the address match fails, the packet is discarded and receive mode restarted (regardless of the `MCSM1.RXOFF_MODE` setting).

If the received address matches a valid address when using infinite packet length mode and address filtering is enabled, 0xFF will be written into the RX FIFO followed by the address byte and then the payload data.

5.16.2.2 Maximum Length Filtering

In variable packet length mode, `PKTCTRL0.LENGTH_CONFIG=1`, the `PKTLEN.PACKET_LENGTH` register value is used to set the maximum allowed packet length. If the received length byte has a larger value than this, the packet is discarded and receive mode restarted (regardless of the `MCSM1.RXOFF_MODE` setting).

5.16.2.3 CRC Filtering

The filtering of a packet when CRC check fails is enabled by setting `PKTCTRL1.CRC_AUTOFLUSH=1`. The CRC auto flush function will flush the entire RX FIFO if the CRC check fails. After auto flushing the RX FIFO, the next state depends on the `MCSM1.RXOFF_MODE` setting.

When using the auto flush function, the maximum packet length is 63 bytes in variable packet length mode and 64 bytes in fixed packet length mode. Note that when `PKTCTRL1.APPEND_STATUS` is enabled, the maximum allowed packet length is reduced by two bytes in order to make room in the RX FIFO for the two status bytes appended at the end of the packet. Since the entire RX FIFO is flushed when the CRC check fails, the previously received packet must be read out of the FIFO before receiving the current packet. The MCU must not read from the current packet until the CRC has been checked as OK.

5.16.3 Packet Handling in Transmit Mode

The payload that is to be transmitted must be written into the TX FIFO. The first byte written must be the length byte when variable packet length is enabled. The length byte has a value equal to the payload of the packet (including the optional address byte). If address recognition is enabled on the receiver, the second byte written to the TX FIFO must be the address byte.

If fixed packet length is enabled, the first byte written to the TX FIFO should be the address (assuming the receiver uses address recognition).

The modulator will first send the programmed number of preamble bytes. If data is available in the TX FIFO, the modulator will send the two-byte (optionally 4-byte) sync word followed by the payload in the TX FIFO. If CRC is enabled, the checksum is calculated over all the data pulled from the TX FIFO, and the result is sent as two extra bytes following the payload data. If the TX FIFO runs empty before the complete packet has been transmitted, the radio will enter `TXFIFO_UNDERFLOW` state. The only way to exit this state is by issuing an `SFTX` strobe. Writing to the TX FIFO after it has underflowed will not restart TX mode.

5.16.4 Packet Handling in Receive Mode

In receive mode, the demodulator and packet handler will search for a valid preamble and the sync word. When found, the demodulator has obtained both bit and byte synchronization and will receive the first payload byte. When variable packet length mode is enabled, the first byte is the length byte.

The packet handler stores this value as the packet length and receives the number of bytes indicated by the length byte. If fixed packet length mode is used, the packet handler will accept the programmed number of bytes.

Next, the packet handler optionally checks the address and only continues the reception if the address matches. If automatic CRC check is enabled, the packet handler computes CRC and matches it with the appended CRC checksum.

At the end of the payload, the packet handler will optionally write two extra packet status bytes (see [Table 5-5](#) and [Table 5-6](#)) that contain CRC status, link quality indication, and RSSI value.

5.16.5 Packet Handling in Firmware

When implementing a packet oriented radio protocol in firmware, the MCU needs to know when a packet has been received/transmitted. Additionally, for packets longer than 64 bytes, the RX FIFO needs to be read while in RX and the TX FIFO needs to be refilled while in TX. This means that the MCU needs to know the number of bytes that can be read from or written to the RX FIFO and TX FIFO respectively. There are two possible solutions to get the necessary status information:

a. Interrupt Driven Solution

The GDO pins can be used in both RX and TX to give an interrupt when a sync word has been received/transmitted or when a complete packet has been received/transmitted by setting `IOCFGx.GDOx_CFG=0x06`. In addition, there are two configurations for the `IOCFGx.GDOx_CFG` register that can be used as an interrupt source to provide information on how many bytes that are in the RX FIFO and TX FIFO respectively. The `IOCFGx.GDOx_CFG=0x00` and the `IOCFGx.GDOx_CFG=0x01` configurations are associated with the RX FIFO while the `IOCFGx.GDOx_CFG=0x02` and the `IOCFGx.GDOx_CFG=0x03` configurations are associated with the TX FIFO. See [Table 5-18](#) for more information.

a. SPI Polling

The `PKTSTATUS` register can be polled at a given rate to get information about the current GDO2 and GDO0 values respectively. The `RXBYTES` and `TXBYTES` registers can be polled at a given rate to get information about the number of bytes in the RX FIFO and TX FIFO respectively. Alternatively, the number of bytes in the RX FIFO and TX FIFO can be read from the chip status byte returned on the MISO line each time a header byte, data byte, or command strobe is sent on the SPI bus.

It is recommended to employ an interrupt driven solution since high rate SPI polling reduces the RX sensitivity. Furthermore, as explained in [Section 5.8](#) and the CC110L Errata Notes [SWRZ037](#), when using SPI polling, there is a small, but finite, probability that a single read from registers `PKTSTATUS`, `RXBYTES` and `TXBYTES` is being corrupt. The same is the case when reading the chip status byte.

5.17 Modulation Formats

CC110L supports amplitude, frequency, and phase shift modulation formats. The desired modulation format is set in the [MDMCFG2.MOD_FORMAT](#) register.

Optionally, the data stream can be Manchester coded by the modulator and decoded by the demodulator. This option is enabled by setting [MDMCFG2.MANCHESTER_EN](#)=1.

NOTE

Manchester encoding is not supported at the same time as using 4-FSK modulation.

5.17.1 Frequency Shift Keying

CC110L supports 2-(G)FSK and 4-FSK modulation. When selecting 4-FSK, the preamble and sync word to be received needs to be 2-FSK (see [Figure 5-8](#)).

When 2-FSK/GFSK/4-FSK modulation is used, the [DEVIATN](#) register specifies the expected frequency deviation of incoming signals in RX and should be the same as the deviation of the transmitted signal for demodulation to be performed reliably and robustly.

The frequency deviation is programmed with the [DEVIATION_M](#) and [DEVIATION_E](#) values in the [DEVIATN](#) register. The value has an exponent/mantissa form, and the resultant deviation is given by:

$$f_{dev} = \frac{f_{XOSC}}{2^{17}} \cdot (8 + DEVIATION_M) \cdot 2^{DEVIATION_E} \tag{5}$$

The symbol encoding is shown in [Table 5-7](#).

Table 5-7. Symbol Encoding for 2-FSK/GFSK and 4-FSK Modulation

Format	Symbol	Coding
2-FSK/GFSK	0	– Deviation
	1	+ Deviation
4-FSK	01	– Deviation
	00	– 1/3xDeviation
	10	+ 1/3xDeviation
	11	+ Deviation

Figure 5-8. Data Sent Over the Air ([MDMCFG2.MOD_FORMAT](#)=100)

5.17.2 Amplitude Modulation

The amplitude modulation supported by CC110L is On-Off Keying (OOK).

OOK modulation simply turns the PA on or off to modulate ones and zeros respectively.

When using OOK, the AGC settings from the SmartRF Studio [SWRC176](#) preferred FSK settings are not optimum. DN022 [SWRA215](#) gives guidelines on how to find optimum OOK settings from the preferred settings in SmartRF Studio [SWRC176](#). The [DEVIATN](#) register setting has no effect in either TX or RX when using OOK.

5.18 Received Signal Qualifiers and RSSI

CC110L has several qualifiers that can be used to increase the likelihood that a valid sync word is detected:

- Sync Word Qualifier
- RSSI
- Carrier Sense
- Clear Channel Assessment

5.18.1 Sync Word Qualifier

If sync word detection in RX is enabled in the [MDMCFG2](#) register, the CC110L will not start filling the RX FIFO and perform the packet filtering described in [Section 5.16.2](#) before a valid sync word has been detected. The sync word qualifier mode is set by [MDMCFG2.SYNC_MODE](#) and is summarized in [Table 5-8](#). Carrier sense described in [Section 5.18.3](#).

Table 5-8. Sync Word Qualifier Mode

MDMCFG2.SYNC_MODE	Sync Word Qualifier Mode
000	No preamble/sync
001	15/16 sync word bits detected
010	16/16 sync word bits detected
011	30/32 sync word bits detected
100	No preamble/sync + carrier sense above threshold
101	15/16 + carrier sense above threshold
110	16/16 + carrier sense above threshold
111	30/32 + carrier sense above threshold

5.18.2 RSSI

The RSSI value is an estimate of the signal power level in the chosen channel. This value is based on the current gain setting in the RX chain and the measured signal level in the channel.

In RX mode, the RSSI value can be read continuously from the **RSSI** status register until the demodulator detects a sync word (when sync word detection is enabled). At that point the RSSI readout value is frozen until the next time the chip enters the RX state.

NOTE

It takes some time from the radio enters RX mode until a valid RSSI value is present in the RSSI register. See DN505 [SWRA114](#) for details on how the RSSI response time can be estimated.

The RSSI value is given in dBm with a ½-dB resolution. The RSSI update rate, f_{RSSI} , depends on the receiver filter bandwidth ($BW_{channel}$ is defined in [Section 5.14](#)) and `AGCCTRL0.FILTER_LENGTH`.

$$f_{RSSI} = \frac{2 \cdot BW_{channel}}{8 \cdot 2^{FILTER_LENGTH}} \tag{6}$$

If `PKTCTRL1.APPEND_STATUS` is enabled, the last RSSI value of the packet is automatically added to the first byte appended after the payload.

The RSSI value read from the **RSSI** status register is a 2s complement number. The following procedure can be used to convert the RSSI reading to an absolute power level (RSSI_dBm).

1. Read the **RSSI** status register
2. Convert the reading from a hexadecimal number to a decimal number (RSSI_dec)
3. If $RSSI_dec \geq 128$ then $RSSI_dBm = (RSSI_dec - 256)/2 - RSSI_offset$
4. Else if $RSSI_dec < 128$ then $RSSI_dBm = (RSSI_dec)/2 - RSSI_offset$

[Table 5-9](#) gives typical values for the `RSSI_offset`. [Figure 5-9](#) and [Figure 5-10](#) show typical plots of RSSI readings as a function of input power level for different data rates.

Table 5-9. Typical RSSI_offset Values

Data rate [kBaud]	RSSI_offset [dB], 433 MHz	RSSI_offset [dB], 868 MHz
1.2	74	74
38.4	74	74
250	74	74

5.18.3 Carrier Sense (CS)

Carrier sense (CS) is used as a sync word qualifier and for Clear Channel Assessment (see [Section 5.18.4](#)). CS can be asserted based on two conditions which can be individually adjusted:

- CS is asserted when the RSSI is above a programmable absolute threshold, and deasserted when RSSI is below the same threshold (with hysteresis). See more in [Section 5.18.3.1](#).
- CS is asserted when the RSSI has increased with a programmable number of dB from one RSSI sample to the next, and deasserted when RSSI has decreased with the same number of dB. This setting is not dependent on the absolute signal level and is thus useful to detect signals in environments with time varying noise floor. See more in [Section 5.18.3.2](#).

Carrier sense can be used as a sync word qualifier that requires the signal level to be higher than the threshold for a sync word search to be performed and is set by setting [MDMCFG2](#). The carrier sense signal can be observed on one of the GDO pins by setting `IOCFGx.GDOx_CFG=14` and in the status register bit [PKTSTATUS.CS](#).

Other uses of Carrier sense include the TX-if-CCA function (see [Section 5.18.4](#)) and the optional fast RX termination (see [Section 5.19.5](#)). CS can be used to avoid interference from other RF sources in the ISM bands.

5.18.3.1 CS Absolute Threshold

The absolute threshold related to the RSSI value depends on the following register fields:

- [AGCCTRL2.MAX_LNA_GAIN](#)
- [AGCCTRL2.MAX_DVGA_GAIN](#)
- [AGCCTRL1.CARRIER_SENSE_ABS_THR](#)
- [AGCCTRL2.MAGN_TARGET](#)

For given [AGCCTRL2.MAX_LNA_GAIN](#) and [AGCCTRL2.MAX_DVGA_GAIN](#) settings, the absolute threshold can be adjusted ± 7 dB in steps of 1 dB using [CARRIER_SENSE_ABS_THR](#).

The [MAGN_TARGET](#) setting is a compromise between blocker tolerance/selectivity and sensitivity. The value sets the desired signal level in the channel into the demodulator. Increasing this value reduces the headroom for blockers, and therefore close-in selectivity. It is strongly recommended to use SmartRF Studio [SWRC176](#) to generate the correct [MAGN_TARGET](#) setting. [Table 5-10](#) shows the typical RSSI readout values at the CS threshold at 250 kBaud data rate. The default reset value for [CARRIER_SENSE_ABS_THR](#) (0 dB) has been used. [MAGN_TARGET=111](#) (42 dB) have been used for the 250 kBaud data rate. For other data rates, the user must generate similar tables to find the CS absolute threshold.

Table 5-10. Typical RSSI Value in dBm at CS Threshold with [MAGN_TARGET](#) = 7 (42 dB) at 250 kBaud, 868 MHz

		MAX_DVGA_GAIN[1:0]			
		00	01	10	11
MAX_LNA_GAIN[2:0]	000	-90.5	-84.5	-78.5	-72.5
	001	-88	-82	-76	-70
	010	-84.5	-78.5	-72	-66
	011	-82.5	-76.5	-70	-64
	100	-80.5	-74.5	-68	-62
	101	-78	-72	-66	-60
	110	-76.5	-70	-64	-58
	111	-74.5	-68	-62	-56

If the threshold is set high, that is, only strong signals are wanted, the threshold should be adjusted upwards by first reducing the MAX_LNA_GAIN value and then the MAX_DVGA_GAIN value. This will reduce power consumption in the receiver front end, since the highest gain settings are avoided.

5.18.3.2 CS Relative Threshold

The relative threshold detects sudden changes in the measured signal level. This setting does not depend on the absolute signal level and is thus useful to detect signals in environments with a time varying noise floor. The register field [AGCCTRL1.CARRIER_SENSE_REL_THR](#) is used to enable/disable relative CS, and to select threshold of 6 dB, 10 dB, or 14 dB RSSI change.

5.18.4 Clear Channel Assessment (CCA)

The Clear Channel Assessment (CCA) is used to indicate if the current channel is free or busy. The current CCA state is viewable on any of the GDO pins by setting `IOCFGx.GDOx_CFG=0x09`.

[MCSM1.CCA_MODE](#) selects the mode to use when determining CCA.

When the STX or SFSTXON command strobe is given while CC110L is in the RX state, the TX or FSTXON state is only entered if the clear channel requirements are fulfilled. Otherwise, the chip will remain in RX. If the channel then becomes available, the radio will not enter TX or FSTXON state before a new strobe command is sent on the SPI interface. This feature is called TX-if-CCA. Four CCA requirements can be programmed:

- Always (CCA disabled, always goes to TX)
- If RSSI is below threshold
- Unless currently receiving a packet
- Both the above (RSSI below threshold and not currently receiving a packet)

5.19 Radio Control

Figure 5-11. Complete Radio Control State Diagram

CC110L has a built-in state machine that is used to switch between different operational states (modes). The change of state is done either by using command strobes or by internal events such as TX FIFO underflow.

A simplified state diagram, together with typical usage and current consumption, is shown in [Figure 5-2](#). The complete radio control state diagram is shown in [Figure 5-11](#). The numbers refer to the state number readable in the `MARCSTATE` status register. This register is primarily for test purposes.

5.19.1 Power-On Start-Up Sequence

When the power supply is turned on, the system must be reset. This is achieved by one of the two sequences described below, that is, automatic power-on reset (POR) or manual reset. After the automatic power-on reset or manual reset, it is also recommended to change the signal that is output on the GDO0 pin. The default setting is to output a clock signal with a frequency of $CLK_XOSC/192$. However, to optimize performance in TX and RX, an alternative GDO setting from the settings found in [Table 5-18](#) should be selected.

5.19.1.1 Automatic POR

A power-on reset circuit is included in the CC110L. The minimum requirements stated in [Section 4.12](#) must be followed for the power-on reset to function properly. The internal power-up sequence is completed when `CHIP_RDYn` goes low. `CHIP_RDYn` is observed on the SO pin after CSn is pulled low. See [Section 5.6](#) for more details on `CHIP_RDYn`. When the CC110L reset is completed, the chip will be in the IDLE state and the crystal oscillator will be running. If the chip has had sufficient time for the crystal oscillator to stabilize after the power-on-reset, the SO pin will go low immediately after taking CSn low. If CSn is taken low before reset is completed, the SO pin will first go high, indicating that the crystal oscillator is not stabilized, before going low as shown in [Figure 5-12](#).

Figure 5-12. Power-On Reset with SRES

5.19.1.2 Manual Reset

The other global reset possibility on CC110L uses the SRES command strobe. By issuing this strobe, all internal registers and states are set to the default, IDLE state. The manual power-up sequence is as follows (see [Figure 5-13](#)):

- Set `SCLK = 1` and `SI = 0`.
- Strobe CSn low / high.
- Hold CSn low and then high for at least 40 μ s relative to pulling CSn low
- Pull CSn low and wait for SO to go low (`CHIP_RDYn`).
- Issue the SRES strobe on the SI line.
- When SO goes low again, reset is complete and the chip is in the IDLE state.

XOSC and voltage regulator switched on

Figure 5-13. Power-On Reset with SRES

NOTE

The above reset procedure is only required just after the power supply is first turned on. If the user wants to reset the CC110L after this, it is only necessary to issue an SRES command strobe.

5.19.2 Crystal Control

The crystal oscillator (XOSC) is either automatically controlled or always on, if [MCSM0.XOSC_FORCE_ON](#) is set.

In the automatic mode, the XOSC will be turned off if the SXOFF or SPWD command strobes are issued; the state machine then goes to XOFF or SLEEP respectively. This can only be done from the IDLE state. The XOSC will be turned off when CSn is released (goes high). The XOSC will be automatically turned on again when CSn goes low. The state machine will then go to the IDLE state. The SO pin on the SPI interface must be pulled low before the SPI interface is ready to be used as described in [Section 5.6](#).

If the XOSC is forced on, the crystal will always stay on even in the SLEEP state.

Crystal oscillator start-up time depends on crystal ESR and load capacitances. The electrical specification for the crystal oscillator can be found in [Section 4.9](#).

5.19.3 Voltage Regulator Control

The voltage regulator to the digital core is controlled by the radio controller. When the chip enters the SLEEP state which is the state with the lowest current consumption, the voltage regulator is disabled. This occurs after CSn is released when a SPWD command strobe has been sent on the SPI interface. The chip is then in the SLEEP state. Setting CSn low again will turn on the regulator and crystal oscillator and make the chip enter the IDLE state.

5.19.4 Active Modes (RX and TX)

CC110L has two active modes: receive and transmit. These modes are activated directly by the MCU by using the SRX and STX command strobes.

The frequency synthesizer must be calibrated regularly. CC110L has one manual calibration option (using the SCAL strobe), and three automatic calibration options that are controlled by the [MCSM0.FS_AUTOCAL](#) setting:

- Calibrate when going from IDLE to either RX or TX (or FSTXON)
- Calibrate when going from either RX or TX to IDLE automatically (not forced in IDLE by issuing an SIDLE strobe)
- Calibrate every fourth time when going from either RX or TX to IDLE automatically (not forced in IDLE by issuing an SIDLE strobe)
- RX: Start search for a new packet

NOTE

When `MCSM1.RXOFF_MODE=11` and a packet has been received, it will take some time before a valid RSSI value is present in the RSSI register again even if the radio has never exited RX mode. This time is the same as the RSSI response time discussed in DN505 [SWRA114](#).

Similarly, when TX is active the chip will remain in the TX state until the current packet has been successfully transmitted. Then the state will change as indicated by the `MCSM1.TXOFF_MODE` setting. The possible destinations are the same as for RX.

The MCU can manually change the state from RX to TX and vice versa by using the command strobes. If the radio controller is currently in transmit and the SRX strobe is used, the current transmission will be ended and the transition to RX will be done.

If the radio controller is in RX when the STX or SFSTXON command strobes are used, the TX- if-CCA function will be used. If the channel is not clear, the chip will remain in RX. The `MCSM1.CCA_MODE` setting controls the conditions for clear channel assessment. See [Section 5.18.4](#).

The SIDLE command strobe can always be used to force the radio controller to go to the IDLE state.

5.19.5 RX Termination

If the system expects the transmission to have started when entering RX mode, the `MCSM2.RX_TIME_RSSI` function can be used. The radio controller will then terminate RX if the first valid carrier sense sample indicates no carrier (RSSI below threshold). See [Section 5.18.3](#) for details on Carrier Sense.

For OOK modulation, lack of carrier sense is only considered valid after eight symbol periods. Thus, the `MCSM2.RX_TIME_RSSI` function can be used in OOK mode when the distance between two “1” symbols is eight or less.

5.19.6 Timing

5.19.6.1 Overall State Transition Times

The main radio controller needs to wait in certain states in order to make sure that the internal analog/digital parts have settled down and are ready to operate in the new states. A number of factors are important for the state transition times:

- The crystal oscillator frequency, f_{xosc}
- OOK used or not
- The data rate in cases where OOK is used
- The value of the `TEST0`, `TEST1`, and `FSCAL3` registers

[Table 5-11](#) shows timing in crystal clock cycles for key state transitions.

Note that the TX to IDLE transition time is a function of data rate (`fbaudrate`). When OOK is used (that is, `FREND0.PA_POWER=001b`), TX to IDLE will require $1/8 \times fbaudrate$ longer times than the time stated in [Table 5-11](#).

Table 5-11. Overall State Transition Times [Example for 26-MHz Crystal Oscillator, 250 kBaud Data Rate, and TEST0 = 0x0B (Maximum Calibration Time)].

Description	Transition Time (FREND0.PA_POWER=0)	Transition Time [μs]
IDLE to RX, no calibration	$1953/f_{xosc}$	75.1
IDLE to RX, with calibration	$1953/f_{xosc} + \text{FS calibration Time}$	799
IDLE to TX/FSTXON, no calibration	$1954/f_{xosc}$	75.2
IDLE to TX/FSTXON, with calibration	$1953/f_{xosc} + \text{FS calibration Time}$	799
TX to RX switch	$782/f_{xosc} + 0.25/f_{baudrate}$	31.1
RX to TX switch	$782/f_{xosc}$	30.1
TX to IDLE, no calibration	$-0.25/f_{baudrate}$	~1
TX to IDLE, with calibration	$-0.25/f_{baudrate} + \text{FS calibration Time}$	725
RX to IDLE, no calibration	$2/f_{xosc}$	~0.1
RX to IDLE, with calibration	$2/f_{xosc} + \text{FS calibration Time}$	724
Manual calibration	$283/f_{xosc} + \text{FS calibration Time}$	735

5.19.6.2 Frequency Synthesizer Calibration Time

Table 5-12 summarizes the frequency synthesizer (FS) calibration times for possible settings of TEST0 and FSCAL3.CHP_CURR_CAL_EN. Setting FSCAL3.CHP_CURR_CAL_EN to 00b disables the charge pump calibration stage. TEST0 is set to the values recommended by SmartRF Studio software. The possible values for TEST0 when operating with different frequency bands are 0x09 and 0x0B. SmartRF Studio software always sets FSCAL3.CHP_CURR_CAL_EN to 10b.

The calibration time can be reduced from 712/724 μs to 145/157 μs. See Section 5.27.2 for more details.

Table 5-12. Frequency Synthesizer Calibration Times (26- and 27-MHz Crystal)

TEST0	FSCAL3.CHP_CURR_CAL_EN	FS Calibration Time $f_{xosc} = 26$ MHz	FS Calibration Time $f_{xosc} = 27$ MHz
0x09	00b	$3764/f_{xosc} = 145 \mu\text{s}$	$3764/f_{xosc} = 139 \mu\text{s}$
0x09	10b	$18506/f_{xosc} = 712 \mu\text{s}$	$18506/f_{xosc} = 685 \mu\text{s}$
0x0B	00b	$4073/f_{xosc} = 157 \mu\text{s}$	$4073/f_{xosc} = 151 \mu\text{s}$
0x0B	10b	$18815/f_{xosc} = 724 \mu\text{s}$	$18815/f_{xosc} = 697 \mu\text{s}$

5.20 Data FIFO

The CC110L contains two 64-byte FIFOs, one for received data and one for data to be transmitted. The SPI interface is used to read from the RX FIFO and write to the TX FIFO. [Section 5.10](#) contains details on the SPI FIFO access. The FIFO controller will detect overflow in the RX FIFO and underflow in the TX FIFO.

When writing to the TX FIFO it is the responsibility of the MCU to avoid TX FIFO overflow. A TX FIFO overflow will result in an error in the TX FIFO content.

Likewise, when reading the RX FIFO the MCU must avoid reading the RX FIFO past its empty value since a RX FIFO underflow will result in an error in the data read out of the RX FIFO.

The chip status byte that is available on the SO pin while transferring the SPI header and contains the fill grade of the RX FIFO if the access is a read operation and the fill grade of the TX FIFO if the access is a write operation. [Section 5.6](#) contains more details on this.

The number of bytes in the RX FIFO and TX FIFO can be read from the status registers [RXBYTES.NUM_RXBYTES](#) and [TXBYTES.NUM_TXBYTES](#) respectively. If a received data byte is written to the RX FIFO at the exact same time as the last byte in the RX FIFO is read over the SPI interface, the RX FIFO pointer is not properly updated and the last read byte will be duplicated. To avoid this problem, the RX FIFO should never be emptied before the last byte of the packet is received.

For packet lengths less than 64 bytes it is recommended to wait until the complete packet has been received before reading it out of the RX FIFO.

If the packet length is larger than 64 bytes, the MCU must determine how many bytes can be read from the RX FIFO ([RXBYTES.NUM_RXBYTES](#)-1). The following software routine can be used:

1. Read [RXBYTES.NUM_RXBYTES](#) repeatedly at a rate specified to be at least twice that of which RF bytes are received until the same value is returned twice; store value in n.
2. If $n < \#$ of bytes remaining in packet, read $n-1$ bytes from the RX FIFO.
3. Repeat steps 1 and 2 until $n =$ number of bytes remaining in packet.
4. Read the remaining bytes from the RX FIFO.

The 4-bit [FIFOTH.R.FIFO_THR](#) setting is used to program threshold points in the FIFOs.

[Table 5-13](#) lists the 16 [FIFO_THR](#) settings and the corresponding thresholds for the RX and TX FIFOs. The threshold value is coded in opposite directions for the RX FIFO and TX FIFO. This gives equal margin to the overflow and underflow conditions when the threshold is reached.

Table 5-13. FIFO_THR Settings and the Corresponding FIFO Thresholds

FIFO_THR	Bytes in TX FIFO	Bytes in RX FIFO
0 (0000)	61	4
1 (0001)	57	8
2 (0010)	53	12
3 (0011)	49	16
4 (0100)	45	20
5 (0101)	41	24
6 (0110)	37	28
7 (0111)	33	32
8 (1000)	29	36
9 (1001)	25	40
10 (1010)	21	44
11 (1011)	17	48
12 (1100)	13	52
13 (1101)	9	56

Table 5-13. FIFO_THR Settings and the Corresponding FIFO Thresholds (continued)

FIFO_THR	Bytes in TX FIFO	Bytes in RX FIFO
14 (1110)	5	60
15 (1111)	1	64

A signal will assert when the number of bytes in the FIFO is equal to or higher than the programmed threshold. This signal can be viewed on the GDO pins (see [Table 5-18](#)).

[Figure 5-14](#) shows the number of bytes in both the RX FIFO and TX FIFO when the threshold signal toggles in the case of FIFO_THR=13. [Figure 5-15](#) shows the signal on the GDO pin as the respective FIFO is filled above the threshold, and then drained below in the case of FIFO_THR=13.

Figure 5-14. Example of FIFOs at Threshold

Figure 5-15. Number of Bytes in FIFO versus the GDO Signal (GDOx_CFG=0x00 in RX and GDOx_CFG=0x02 in TX, FIFO_THR=13)

5.21 Frequency Programming

The frequency programming in CC110L is designed to minimize the programming needed when changing frequency.

To set up a system with channel numbers, the desired channel spacing is programmed with the [MDMCFG0.CHANSPC_M](#) and [MDMCFG1.CHANSPC_E](#) registers. The channel spacing registers are mantissa and exponent respectively. The base or start frequency is set by the 24 bit frequency word located in the [FREQ2](#), [FREQ1](#), and [FREQ0](#) registers. This word will typically be set to the center of the lowest channel frequency that is to be used.

The desired channel number is programmed with the 8-bit channel number register, [CHANNR.CHAN](#), which is multiplied by the channel offset. The resultant carrier frequency is given by:

$$f_{\text{carrier}} = \frac{f_{\text{XOSC}}}{2^{16}} \cdot (\text{FREQ} + \text{CHAN} \cdot ((256 + \text{CHANSPC_M}) \cdot 2^{\text{CHANSPC_E}-2})) \quad (7)$$

With a 26 MHz crystal the maximum channel spacing is 405 kHz. To get that is, 1-MHz channel spacing, one solution is to use 333 kHz channel spacing and select each third channel in [CHANNR.CHAN](#).

The preferred IF frequency is programmed with the [FSCTRL1.FREQ_IF](#) register. The IF frequency is given by:

$$f_{\text{IF}} = \frac{f_{\text{XOSC}}}{2^{10}} \cdot \text{FREQ_IF} \quad (8)$$

If any frequency programming register is altered when the frequency synthesizer is running, the synthesizer may give an undesired response. Hence, the frequency should only be updated when the radio is in the IDLE state.

5.22 VCO

The VCO is completely integrated on-chip.

5.22.1 VCO and PLL Self-Calibration

The VCO characteristics vary with temperature and supply voltage changes as well as the desired operating frequency. In order to ensure reliable operation, CC110L includes frequency synthesizer self-calibration circuitry. This calibration should be done regularly, and must be performed after turning on power and before using a new frequency (or channel). The number of XOSC cycles for completing the PLL calibration is given in [Table 5-11](#).

The calibration can be initiated automatically or manually. The synthesizer can be automatically calibrated each time the synthesizer is turned on, or each time the synthesizer is turned off automatically. This is configured with the [MCSM0.FS_AUTOCAL](#) register setting. In manual mode, the calibration is initiated when the SCAL command strobe is activated in the IDLE mode.

NOTE

The calibration values are maintained in SLEEP mode, so the calibration is still valid after waking up from SLEEP mode unless supply voltage or temperature has changed significantly.

To check that the PLL is in lock, the user can program register [IOCFGx.GDOx_CFG](#) to 0x0A, and use the lock detector output available on the GDOx pin as an interrupt for the MCU (x = 0,1, or 2). A positive transition on the GDOx pin means that the PLL is in lock. As an alternative the user can read register [FSCAL1](#). The PLL is in lock if the register content is different from 0x3F. Refer also to the CC110L Errata Notes [SWRZ037](#).

For more robust operation, the source code could include a check so that the PLL is re-calibrated until PLL lock is achieved if the PLL does not lock the first time.

5.23 Voltage Regulators

CC110L contains several on-chip linear voltage regulators that generate the supply voltages needed by low-voltage modules. These voltage regulators are invisible to the user, and can be viewed as integral parts of the various modules. The user must however make sure that the absolute maximum ratings and required pin voltages in [Table 3-1](#) and [Table 5-1](#) are not exceeded.

By setting the CSn pin low, the voltage regulator to the digital core turns on and the crystal oscillator starts. The SO pin on the SPI interface must go low before the first positive edge of SCLK (setup time is given in [Table 5-1](#)).

If the chip is programmed to enter power-down mode (SPWD strobe issued), the power will be turned off after CSn goes high. The power and crystal oscillator will be turned on again when CSn goes low.

The voltage regulator for the digital core requires one external decoupling capacitor.

The voltage regulator output should only be used for driving the CC110L.

5.24 Output Power Programming

The RF output power level from the device has two levels of programmability. The PATABLE register can hold two user selected output power settings and the `FREND0.PA_POWER` value selects the PATABLE entry to use (0 or 1). PATABLE must be programmed in burst mode if writing to other entries than PATABLE[0]. See [Section 5.11](#) for more programming details.

For OOK modulation, `FREND0.PA_POWER` should be 1 and the logic 0 and logic 1 power levels shall be programmed to index 0 and 1 respectively. For all other modulation formats, the desired output power should be programmed to index 0.

[Table 5-14](#) contains the recommended PATABLE settings for various output levels and frequency bands. DN013 [SWRA168](#) gives the complete tables for the different frequency bands using multi-layer inductors. Using PA settings from 0x61 to 0x6F is not allowed. [Table 5-17](#) contains output power and current consumption for default PATABLE setting (0xC6). The measurements are done on [SWRR045](#).

NOTE

All content of the PATABLE except for the first byte (index 0) is lost when entering the SLEEP state.

Table 5-14. Optimum PATABLE Settings for Various Output Power Levels Using Wire-Wound Inductors in 868- and 915-MHz Frequency Bands

Output Power [dBm]	868 MHz		915 MHz	
	Setting	Current Consumption, Typ. [mA]	Setting	Current Consumption, Typ. [mA]
12/11	0xC0	34.2	0xC0	33.4
10	0xC5	30.0	0xC3	30.7
7	0xCD	25.8	0xCC	25.7

	Current Consumption, Typ. [mA]	Output Power [dBm]	Current Consumption, Typ. [mA]	Output Power [dBm]
0xC6	8.5	29.5	7.2	27.4

5.25 General Purpose and Test Output Control Pins

The three digital output pins GDO0, GDO1, and GDO2 are general control pins configured with [IOCFG0.GDO0_CFG](#), [IOCFG1.GDO1_CFG](#), and [IOCFG2.GDO2_CFG](#) respectively. [Table 5-18](#) shows the different signals that can be monitored on the GDO pins. These signals can be used as inputs to the MCU.

GDO1 is the same pin as the SO pin on the SPI interface, thus the output programmed on this pin will only be valid when CS_n is high. The default value for GDO1 is 3-stated which is useful when the SPI interface is shared with other devices.

The default value for GDO0 is a 135-141 kHz clock output (XOSC frequency divided by 192). Since the XOSC is turned on at power-on-reset, this can be used to clock the MCU in systems with only one crystal. When the MCU is up and running, it can change the clock frequency by writing to [IOCFG0.GDO0_CFG](#).

If the [IOCFGx.GDOx_CFG](#) setting is less than 0x20 and [IOCFGx_GDOx_INV](#) is 0 (1), the GDO0 and GDO2 pins will be hardwired to 0 (1), and the GDO1 pin will be hardwired to 1 (0) in the SLEEP state. These signals will be hardwired until the [CHIP_RDYn](#) signal goes low.

If the [IOCFGx.GDOx_CFG](#) setting is 0x20 or higher, the GDO pins will work as programmed also in SLEEP state. As an example, GDO1 is high impedance in all states if [IOCFG1.GDO1_CFG=0x2E](#).

Table 5-18. GDOx Signal Selection (x = 0, 1, or 2)

GDOx_CFG [5:0]	Description ⁽¹⁾
0 (0x00)	Associated to the RX FIFO: Asserts when RX FIFO is filled at or above the RX FIFO threshold. Deasserts when RX FIFO is drained below the same threshold.
1 (0x01)	Associated to the RX FIFO: Asserts when RX FIFO is filled at or above the RX FIFO threshold or the end of packet is reached. Deasserts when the RX FIFO is empty.
2 (0x02)	Associated to the TX FIFO: Asserts when the TX FIFO is filled at or above the TX FIFO threshold. Deasserts when the TX FIFO is below the same threshold.
3 (0x03)	Associated to the TX FIFO: Asserts when TX FIFO is full. Deasserts when the TX FIFO is drained below the TX FIFO threshold.
4 (0x04)	Asserts when the RX FIFO has overflowed. Deasserts when the FIFO has been flushed.
5 (0x05)	Asserts when the TX FIFO has underflowed. Deasserts when the FIFO is flushed.
6 (0x06)	Asserts when sync word has been sent / received, and de-asserts at the end of the packet. In RX, the pin will also de-assert when a packet is discarded due to address or maximum length filtering or when the radio enters RXFIFO_OVERFLOW state. In TX the pin will de-assert if the TX FIFO underflows.
7 (0x07)	Asserts when a packet has been received with CRC OK. Deasserts when the first byte is read from the RX FIFO.
8 (0x08)	Reserved - used for test.
9 (0x09)	Clear channel assessment. High when RSSI level is below threshold (dependent on the current CCA_MODE setting).
10 (0x0A)	Lock detector output. The PLL is in lock if the lock detector output has a positive transition or is constantly logic high. To check for PLL lock the lock detector output should be used as an interrupt for the MCU.
11 (0x0B)	Serial Clock. Synchronous to the data in synchronous serial mode. In RX mode, data is set up on the falling edge by CC110L when GDOx_INV=0. In TX mode, data is sampled by CC110L on the rising edge of the serial clock when GDOx_INV=0.
12 (0x0C)	Serial Synchronous Data Output. Used for synchronous serial mode.
13 (0x0D)	Serial Data Output. Used for asynchronous serial mode.
14 (0x0E)	Carrier sense. High if RSSI level is above threshold. Cleared when entering IDLE mode.
15 (0x0F)	CRC_OK. The last CRC comparison matched. Cleared when entering/restarting RX mode.
16 (0x10) – 26 (0x1A)	Reserved - used for test.
27 (0x1B)	PA_PD. Note: PA_PD will have the same signal level in SLEEP and TX states. To control an external PA or RX/TX switch in applications where the SLEEP state is used it is recommended to use GDOx_CFGx=0x2F instead.

(1) There are 3 GDO pins, but only one CLK_XOSC/n can be selected as an output at any time. If CLK_XOSC/n is to be monitored on one of the GDO pins, the other two GDO pins must be configured to values less than 0x30. The GDO0 default value is CLK_XOSC/192. To optimize RF performance, these signals should not be used while the radio is in RX or TX mode.

Table 5-18. GDOx Signal Selection (x = 0, 1, or 2) (continued)

GDOx_CFG [5:0]	Description ⁽¹⁾	
28 (0x1C)	LNA_PD. Note: LNA_PD will have the same signal level in SLEEP and RX states. To control an external LNA or RX/TX switch in applications where the SLEEP state is used it is recommended to use GDOx_CFGx=0x2F instead.	
29 (0x1D) – 38 (0x26)	Reserved - used for test.	
39 (0x27)	CLK_32k.	
40 (0x28)	Reserved - used for test.	
41 (0x29)	CHIP_RDYn.	
42 (0x2A)	Reserved - used for test.	
43 (0x2B)	XOSC_STABLE.	
44 (0x2C) - 45 (0x2D)	Reserved - used for test.	
46 (0x2E)	High impedance (3-state).	
47 (0x2F)	HW to 0 (HW1 achieved by setting GDOx_INV=1). Can be used to control an external LNA/PA or RX/TX switch.	
48 (0x30)	CLK_XOSC/1	Note: There are 3 GDO pins, but only one CLK_XOSC/n can be selected as an output at any time. If CLK_XOSC/n is to be monitored on one of the GDO pins, the other two GDO pins must be configured to values less than 0x30. The GDO0 default value is CLK_XOSC/192. To optimize RF performance, these signals should not be used while the radio is in RX mode.
49 (0x31)	CLK_XOSC/1.5	
50 (0x32)	CLK_XOSC/2	
51 (0x33)	CLK_XOSC/3	
52 (0x34)	CLK_XOSC/4	
53 (0x35)	CLK_XOSC/6	
54 (0x36)	CLK_XOSC/8	
55 (0x37)	CLK_XOSC/12	
56 (0x38)	CLK_XOSC/16	
57 (0x39)	CLK_XOSC/24	
58 (0x3A)	CLK_XOSC/32	
59 (0x3B)	CLK_XOSC/48	
60 (0x3C)	CLK_XOSC/64	
61 (0x3D)	CLK_XOSC/96	
62 (0x3E)	CLK_XOSC/128	
63 (0x3F)	CLK_XOSC/192	

5.26 Asynchronous and Synchronous Serial Operation

Several features and modes of operation have been included in the CC110L to provide backward compatibility with previous Chipcon products and other existing RF communication systems. For new systems, it is recommended to use the built-in packet handling features, as they can give more robust communication, significantly offload the microcontroller, and simplify software development.

5.26.1 Asynchronous Serial Operation

Asynchronous transfer is included in the CC110L for backward compatibility with systems that are already using the asynchronous data transfer.

When asynchronous transfer is enabled, all packet handling support is disabled and it is not possible to use Manchester encoding.

Asynchronous serial mode is enabled by setting `PKTCTRL0.PKT_FORMAT` to 3. Strobing STX will configure the GDO0 pin as data input (TX data) regardless of the content of the `IOCFG0` register. Data output can be on GDO0, GDO1, or GDO2. This is set by the `IOCFG0.GDO0_CFG`, `IOCFG1.GDO1_CFG` and `IOCFG2.GDO2_CFG` fields.

The CC110L modulator samples the level of the asynchronous input 8 times faster than the programmed data rate. The timing requirement for the asynchronous stream is that the error in the bit period must be less than one eighth of the programmed data rate.

In asynchronous serial mode no data decision is done on-chip and the raw data is put on the data output line. When using asynchronous serial mode make sure the interfacing MCU does proper oversampling and that it can handle the jitter on the data output line. The MCU should tolerate a jitter of $\pm 1/8$ of a bit period as the data stream is time-discrete using 8 samples per bit.

In asynchronous serial mode there will be glitches of 37 - 38.5 ns duration ($1/XOSC$) occurring infrequently and with random periods. A simple RC filter can be added to the data output line between CC110L and the MCU to get rid of the 37 - 38.5 ns glitches if considered a problem. The filter 3 dB cut-off frequency needs to be high enough so that the data is not filtered and at the same time low enough to remove the glitch. As an example, for 2.4 kBaud data rate a 1 k Ω resistor and 2.7 nF capacitor can be used. This gives a 3 dB cut-off frequency of 59 kHz.

5.26.2 Synchronous Serial Operation

Setting `PKTCTRL0.PKT_FORMAT` to 1 enables synchronous serial mode. When using this mode, sync detection should be disabled together with CRC calculation (`MDMCFG2.SYNC_MODE=000` and `PKTCTRL0.CRC_EN=0`). Infinite packet length mode should be used (`PKTCTRL0.LENGTH_CONFIG=10b`).

In synchronous serial mode, data is transferred on a two-wire serial interface. The CC110L provides a clock that is used to set up new data on the data input line or sample data on the data output line. Data input (TX data) is on the GDO0 pin. This pin will automatically be configured as an input when TX is active. The TX latency is 8 bits. The data output pin can be any of the GDO pins. This is set by the `IOCFG0.GDO0_CFG`, `IOCFG1.GDO1_CFG`, and `IOCFG2.GDO2_CFG` fields. The RX latency is 9 bits.

The MCU must handle preamble and sync word detection in software.

The MCU must handle preamble and sync word insertion/detection in software, together with CRC calculation and insertion.

5.27 System Considerations and Guidelines

5.27.1 SRD Regulations

International regulations and national laws regulate the use of radio receivers and transmitters. Short Range Devices (SRDs) for license free operation below 1 GHz are usually operated in the 315 MHz, 433 MHz, 868 MHz or 915 MHz frequency bands. The CC110L is specifically designed for such use with its 300 - 348 MHz, 387 - 464 MHz, and 779 - 928 MHz operating ranges. The most important regulations when using the CC110L in the 315 MHz, 433 MHz, 868 MHz, or 915 MHz frequency bands are EN 300 220 V2.3.1 (Europe) and FCC CFR47 Part 15 (USA).

For compliance with modulation bandwidth requirements under EN 300 220 V2.3.1 in the 863 to 870 MHz frequency range it is recommended to use a 26 MHz crystal for frequencies below 869 MHz and a 27 MHz crystal for frequencies above 869 MHz.

Compliance with regulations is dependent on the complete system performance. It is the customer's responsibility to ensure that the system complies with regulations.

5.27.2 Frequency Hopping and Multi-Channel Systems

CC110L is highly suited for FHSS or multi-channel systems due to its agile frequency synthesizer and effective communication interface.

Charge pump current, VCO current, and VCO capacitance array calibration data is required for each frequency when implementing frequency hopping for CC110L. There are 3 ways of obtaining the calibration data from the chip:

1. Frequency hopping with calibration for each hop. The PLL calibration time is 712/724 μ s (26 MHz crystal and `TEST0 = 0x09/0B`, see [Table 5-12](#)). The blanking interval between each frequency hop is then 787/799 μ s.
2. Fast frequency hopping without calibration for each hop can be done by performing the necessary calibrating at startup and saving the resulting `FSCAL3`, `FSCAL2`, and `FSCAL1` register values in MCU memory. The VCO capacitance calibration `FSCAL1` register value must be found for each RF frequency to be used. The VCO current calibration value and the charge pump current calibration value available in `FSCAL2` and `FSCAL3` respectively are not dependent on the RF frequency, so the same value can therefore be used for all RF frequencies for these two registers. Between each frequency hop, the calibration process can then be replaced by writing the `FSCAL3`, `FSCAL2` and `FSCAL1` register values that corresponds to the next RF frequency. The PLL turn on time is approximately 75 μ s (see [Table 5-11](#)). The blanking interval between each frequency hop is then approximately 75 μ s.
3. Run calibration on a single frequency at startup. Next write 0 to `FSCAL3[5:4]` to disable the charge pump calibration. After writing to `FSCAL3[5:4]`, strobe SRX (or STX) with `MCSM0.FS_AUTOCAL=1` for each new frequency hop. That is, VCO current and VCO capacitance calibration is done, but not charge pump current calibration. When charge pump current calibration is disabled the calibration time is reduced from 712/724 μ s to 145/157 μ s (26 MHz crystal and `TEST0 = 0x09/0B`, see [Table 5-12](#)). The blanking interval between each frequency hop is then 220/232 μ s.

There is a trade off between blanking time and memory space needed for storing calibration data in non-volatile memory. Solution 2) above gives the shortest blanking interval, but requires more memory space to store calibration values. This solution also requires that the supply voltage and temperature do not vary much in order to have a robust solution. Solution 3) gives 567 μ s smaller blanking interval than solution 1).

The recommended settings for `TEST0.VCO_SEL_CAL_EN` change with frequency. This means that one should always use SmartRF Studio to get the correct settings for a specific frequency before doing a calibration, regardless of which calibration method is being used.

NOTE

The content in the [TEST0](#) register is not retained in SLEEP state, thus it is necessary to re-write this register when returning from the SLEEP state.

5.27.3 Wideband Modulation when not Using Spread Spectrum

Digital modulation systems under FCC Section 15.247 include 2-FSK, GFSK, and 4-FSK modulation. A maximum peak output power of 1 W (+30 dBm) is allowed if the 6 dB bandwidth of the modulated signal exceeds 500 kHz. In addition, the peak power spectral density conducted to the antenna shall not be greater than +8 dBm in any 3 kHz band.

Operating at high data rates and frequency separation, the CC110L is suited for systems targeting compliance with digital modulation system as defined by FCC Section 15.247. An external power amplifier such as CC1190 [SWRS089](#) is needed to increase the output above +11 dBm. Refer to DN006 [SWRA123](#) for further details concerning wideband modulation and CC110L.

5.27.4 Data Burst Transmissions

The high maximum data rate of CC110L opens up for burst transmissions. A low average data rate link (that is, 10 kBaud) can be realized by using a higher over-the-air data rate. Buffering the data and transmitting in bursts at high data rate (that is, 500 kBaud) will reduce the time in active mode, and hence also reduce the average current consumption significantly.

Reducing the time in active mode will reduce the likelihood of collisions with other systems in the same frequency range.

NOTE

The sensitivity and thus transmission range is reduced for high data rate bursts compared to lower data rates.

5.27.5 Continuous Transmissions

In data streaming applications, the CC110L opens up for continuous transmissions at 500 kBaud effective data rate. As the modulation is done with a closed loop PLL, there is no limitation in the length of a transmission (open loop modulation used in some transceivers often prevents this kind of continuous data streaming and reduces the effective data rate).

5.27.6 Increasing Range

In some applications it may be necessary to extend the range. The CC1190 [SWRS089](#) is a range extender for 850-950 MHz RF transceivers, transmitters, and System-on-Chip devices from Texas Instruments. It increases the link budget by providing a power amplifier (PA) for increased output power, and a low-noise amplifier (LNA) with low noise figure for improved receiver sensitivity in addition to switches and RF matching for simple design of high performance wireless systems. Refer to AN094 [SWRA356](#) and AN096 [SWRA361](#) for performance figures of the CC110L and CC1190 combination. [Figure 5-16](#) shows a simplified application circuit.

5.28 Configuration Registers

The configuration of CC110L is done by programming 8-bit registers. The optimum configuration data based on selected system parameters are most easily found by using the SmartRF Studio software . Complete descriptions of the registers are given in the following tables. After chip reset, all the registers have default values as shown in the tables. The optimum register setting might differ from the default value. After a reset, all registers that shall be different from the default value therefore needs to be programmed through the SPI interface.

There are 11 command strobe registers, listed in [Table 5-19](#). Accessing these registers will initiate the change of an internal state or mode. There are 44 normal 8-bit configuration registers listed in [Table 5-20](#) and SmartRF Studio will provide recommended settings for these registers (Addresses marked as “Not Used” can be part of a burst access and one can write a dummy value to them. Addresses marked as “Reserved” must be configured according to SmartRF Studio).

There are also 9 status registers that are listed in [Table 5-21](#). These registers, which are read- only, contain information about the status of CC110L.

The two FIFOs are accessed through one 8-bit register. Write operations write to the TX FIFO, while read operations read from the RX FIFO.

During the header byte transfer and while writing data to a register or the TX FIFO, a status byte is returned on the SO line. This status byte is described in [Table 5-2](#).

[Table 5-22](#) summarizes the SPI address space. The address to use is given by adding the base address to the left and the burst and read/write bits on the top. Note that the burst bit has different meaning for base addresses above and below 0x2F.

Table 5-19. Command Strokes

Address	Strobe Name	Description
0x30	SRES	Reset chip.
0x31	SFSTXON	Enable and calibrate frequency synthesizer (if <code>MCSM0.FS_AUTOCAL=1</code>). If in RX (with CCA): Go to a wait state where only the synthesizer is running (for quick RX / TX turnaround).
0x32	SXOFF	Turn off crystal oscillator.
0x33	SCAL	Calibrate frequency synthesizer and turn it off. SCAL can be strobed from IDLE mode without setting manual calibration mode (<code>MCSM0.FS_AUTOCAL=0</code>)
0x34	SRX	In IDLE state: Enable RX. Perform calibration first if <code>MCSM0.FS_AUTOCAL=1</code> .
0x35	STX	In IDLE state: Enable TX. Perform calibration first if <code>MCSM0.FS_AUTOCAL=1</code> . If in RX state and CCA is enabled: Only go to TX if channel is clear.
0x36	SIDLE	Enter IDLE state
0x37 - 0x38	Reserved	
0x39	SPWD	Enter power down mode when CSn goes high.
0x3A	SFRX	Flush the RX FIFO buffer. Only issue SFRX in IDLE or RXFIFO_OVERFLOW states.
0x3B	SFTX	Flush the TX FIFO buffer. Only issue SFTX in IDLE or TXFIFO_UNDERFLOW states.
0x3C	Reserved	
0x3D	SNOP	No operation. May be used to get access to the chip status byte.

Table 5-20. Configuration Registers Overview

Address	Register	Description	Preserved in SLEEP State	Details on Page Number

5.28.1 Configuration Register Details - Registers with preserved values in SLEEP state

Table 5-23. 0x00: IOCFG2 - GDO2 Output Pin Configuration

Bit	Field Name	Reset	R/W	Description
7			R0	Not used
6	GDO2_INV	0	R/W	Invert output, that is, select active low (1) / high (0)
5:0	GDO2_CFG[5:0]	41 (101001)	R/W	Default is CHP_RDYn (see Table 5-18).

Table 5-24. 0x01: IOCFG1 - GDO1 Output Pin Configuration

Bit	Field Name	Reset	R/W	Description
7	GDO_DS	0	R/W	Set high (1) or low (0) output drive strength on the GDO pins.
6	GDO1_INV	0	R/W	Invert output, that is, select active low (1) / high (0)
5:0	GDO1_CFG[5:0]	46 (101110)	R/W	Default is 3-state (see Table 5-18).

Table 5-25. 0x02: IOCFG0 - GDO0 Output Pin Configuration

Bit	Field Name	Reset	R/W	Description
7		0	R/W	Use setting from SmartRF Studio
6	GDO0_INV	0	R/W	Invert output, that is, select active low (1) / high (0)
5:0	GDO0_CFG[5:0]	63 (0x3F)	R/W	Default is CLK_XOSC/192 (see Table 5-18). It is recommended to disable the clock output in initialization, in order to optimize RF performance.

Table 5-26. 0x03: FIFOTHR - RX FIFO and TX FIFO Thresholds

Bit	Field Name	Reset	R/W	Description

Table 5-27. 0x04: SYNC1 - Sync Word, High Byte

Bit	Field Name	Reset	R/W	Description
7:0	SYNC[15:8]	211 (0xD3)	R/W	8 MSB of 16-bit sync word

Table 5-28. 0x05: SYNC0 - Sync Word, Low Byte

Bit	Field Name	Reset	R/W	Description
7:0	SYNC[7:0]	145 (0x91)	R/W	8 LSB of 16-bit sync word

Table 5-29. 0x06: PKTLEN - Packet Length

Bit	Field Name	Reset	R/W	Description
7:0	PACKET_LENGTH	255 (0xFF)	R/W	Indicates the packet length when fixed packet length mode is enabled. If variable packet length mode is used, this value indicates the maximum packet length allowed. This value must be different from 0.

Table 5-30. 0x07: PKTCTRL1 - Packet Automation Control

Bit	Field Name	Reset	R/W	Description	
7:5		0 (000)	R/W	Use setting from SmartRF Studio	
4		0	R0	Not Used.	
3	CRC_AUTOFLUSH	0	R/W	Enable automatic flush of RX FIFO when CRC is not OK. This requires that only one packet is in the RX FIFO and that packet length is limited to the RX FIFO size.	
2	APPEND_STATUS	1	R/W	When enabled, two status bytes will be appended to the payload of the packet. The status bytes contain the RSSI value, as well as CRC OK.	
1:0	ADR_CHK[1:0]	0 (00)	R/W	Controls address check configuration of received packages.	
				Setting	Address check configuration
				0 (00)	No address check
				1 (01)	Address check, no broadcast
				2 (10)	Address check and 0 (0x00) broadcast
3 (11)	Address check and 0 (0x00) and 255 (0xFF) broadcast				

Table 5-31. 0x08: PKTCTRL0 - Packet Automation Control

Bit	Field Name	Reset	R/W	Description	
7			R0	Not used	
6		1	R/W	Use setting from SmartRF Studio	
5:4	PKT_FORMAT[1:0]	0 (00)	R/W	Format of RX data	
				Setting	Packet format
				0 (00)	Normal mode, use FIFOs for RX and TX
				1 (01)	Synchronous serial mode. Data in on GDO0 and data out on either of the GDOx pins
				2 (10)	Random TX mode; sends random data using PN9 generator. Used for test. Works as normal mode, setting 0 (00), in RX
3 (11)	Asynchronous serial mode. Data in on GDO0 and data out on either of the GDOx pins				
3		0	R0	Not used	
2	CRC_EN	1	R/W	1: CRC calculation enabled 0: CRC calculation disabled	

Table 5-31. 0x08: PKTCTRL0 - Packet Automation Control (continued)

Bit	Field Name	Reset	R/W	Description	
1:0	LENGTH_CONFIG[1:0]	1 (01)	R/W	Configure the packet length	
				Setting	Packet length configuration
				0 (00)	Fixed packet length mode. Length configured in PKTLEN register
				1 (01)	Variable packet length mode. Packet length configured by the first byte after sync word
				2 (10)	Infinite packet length mode
				3 (11)	Reserved

Table 5-32. 0x09: ADDR - Device Address

Bit	Field Name	Reset	R/W	Description
7:0	DEVICE_ADDR[7:0]	0 (0x00)	R/W	Address used for packet filtration. Optional broadcast addresses are 0 (0x00) and 255 (0xFF).

Table 5-33. 0x0A: CHANNR - Channel Number

Bit	Field Name	Reset	R/W	Description
7:0	CHAN[7:0]	0 (0x00)	R/W	The 8-bit unsigned channel number, which is multiplied by the channel spacing setting and added to the base frequency.

Table 5-34. 0x0B: FSCTRL1 - Frequency Synthesizer Control

Bit	Field Name	Reset	R/W	Description
7:6			R0	Not used
5		0	R/W	Use setting from SmartRF Studio
4:0	FREQ_IF[4:0]	15 (01111)	R/W	<p>The desired IF frequency to employ in RX. Subtracted from FS base frequency in RX and controls the digital complex mixer in the demodulator.</p> $f_{IF} = \frac{f_{XOSC}}{2^{10}} \cdot FREQ_IF$ <p>The default value gives an IF frequency of 381kHz, assuming a 26.0 MHz crystal.</p>

Table 5-35. 0x0C: FSCTRL0 - Frequency Synthesizer Control

Bit	Field Name	Reset	R/W	Description
7:0	FREQOFF[7:0]	0 (0x00)	R/W	Frequency offset added to the base frequency before being used by the frequency synthesizer. (2s-complement). Resolution is $FXTAL/2^{14}$ (1.59kHz-1.65kHz); range is ± 202 kHz to ± 210 kHz, dependent of XTAL frequency.

Table 5-36. 0x0D: FREQ2 - Frequency Control Word, High Byte

Bit	Field Name	Reset	R/W	Description
7:6	FREQ[23:22]	0 (00)	R	FREQ[23:22] is always 0 (the FREQ2 register is less than 36 with 26 - 27 MHz crystal)
5:0	FREQ[21:16]	30 (011110)	R/W	<p>FREQ[23:0] is the base frequency for the frequency synthesizer in increments of $f_{XOSC}/2^{16}$.</p> $f_{carrier} = \frac{f_{XOSC}}{2^{16}} \cdot FREQ[23 : 0]$

Table 5-37. 0x0E: FREQ1 - Frequency Control Word, Middle Byte

Bit	Field Name	Reset	R/W	Description
7:0	FREQ[15:8]	196 (0xC4)	R/W	See Table 5-36 .

Table 5-38. 0x0F: FREQ0 - Frequency Control Word, Low Byte

Bit	Field Name	Reset	R/W	Description
7:0	FREQ[7:0]	236 (0xEC)	R/W	See Table 5-36 .

Table 5-39. 0x10: MDMCFG4 - Modem Configuration

Bit	Field Name	Reset	R/W	Description
7:6	CHANBW_E[1:0]	2 (10)	R/W	
5:4	CHANBW_M[1:0]	0 (00)	R/W	<p>Sets the decimation ratio for the delta-sigma ADC input stream and thus the channel bandwidth.</p> $BW_{\text{channel}} = \frac{f_{\text{XOSC}}}{8 \cdot (4 + \text{CHANBW_M}) \cdot 2^{\text{CHANBW_E}}}$ <p>The default values give 203 kHz channel filter bandwidth, assuming a 26.0 MHz crystal.</p>
3:0	DRATE_E[3:0]	12 (1100)	R/W	The exponent of the user specified symbol rate

Table 5-40. 0x11: MDMCFG3 - Modem Configuration

Bit	Field Name	Reset	R/W	Description
7:0	DRATE_M[7:0]	34 (0x22)	R/W	<p>The mantissa of the user specified symbol rate. The symbol rate is configured using an unsigned, floating-point number with 9-bit mantissa and 4-bit exponent. The 9th bit is a hidden '1'. The resulting data rate is:</p> $R_{\text{DATA}} = \frac{(256 + \text{DRATE_M}) \cdot 2^{\text{DRATE_E}}}{2^{28}} \cdot f_{\text{XOSC}}$ <p>The default values give a data rate of 115.051 kBaud (closest setting to 115.2 kBaud), assuming a 26.0 MHz crystal.</p>

Table 5-41. 0x12: MDMCFG2 - Modem Configuration

Bit	Field Name	Reset	R/W	Description	
7	DEM_DCFILT_OFF	0	R/W	<p>Disable digital DC blocking filter before demodulator.</p> <p>0 = Enable (better sensitivity)</p> <p>1 = Disable (current optimized). Only for data rates ≤ 250 kBaud</p> <p>The recommended IF frequency changes when the DC blocking is disabled. Use SmartRF Studio to calculate correct register setting.</p>	
6:4	MOD_FORMAT[2:0]	0 (000)	R/W	The modulation format of the radio signal	
				Setting	Modulation format
				0 (000)	2-FSK
				1 (001)	GFSK
				2 (010)	Reserved
				3 (011)	OOK
				4 (100)	4-FSK
				5 (101)	Reserved
				6 (110)	Reserved
7 (111)	Reserved				
				4-FSK modulation cannot be used together with Manchester encoding	
3	MANCHESTER_EN	0	R/W	<p>Enables Manchester encoding/decoding.</p> <p>0 = Disable</p> <p>1 = Enable</p> <p>Manchester encoding cannot be used when using asynchronous serial mode or 4-FSK modulation</p>	
2:0	SYNC_MODE[2:0]	2 (010)	R/W	Combined sync-word qualifier mode.	
				The values 0 and 4 disables preamble and sync word detection	
				The values 1, 2, 5, and 6 enables 16-bit sync word detection. Only 15 of 16 bits need to match when using setting 1 or 5. The values 3 and 7 enables 32-bits sync word detection (only 30 of 32 bits need to match).	
				Setting	Sync-word qualifier mode
				0 (000)	No preamble/sync
				1 (001)	15/16 sync word bits detected
				2 (010)	16/16 sync word bits detected
				3 (011)	30/32 sync word bits detected
				4 (100)	No preamble/sync, carrier-sense above threshold
5 (101)	15/16 + carrier-sense above threshold				
6 (110)	16/16 + carrier-sense above threshold				
7 (111)	30/32 + carrier-sense above threshold				

Table 5-42. 0x13: MDMCFG1 - Modem Configuration

Bit	Field Name	Reset	R/W	Description	
7		0	R/W	Use setting from SmartRF Studio	
6:4	NUM_PREAMBLE[2:0]	2 (010)	R/W	Sets the minimum number of preamble bytes to be transmitted	
				Setting	Number of preamble bytes
				0 (000)	2
				1 (001)	3
				2 (010)	4
				3 (011)	6
				4 (100)	8
				5 (101)	12
				6 (110)	16
				7 (111)	24
3:2			R0	Not used	
1:0	CHANSPC_E[1:0]	2 (10)	R/W	2 bit exponent of channel spacing	

Table 5-43. 0x14: MDMCFG0 - Modem Configuration

Bit	Field Name	Reset	R/W	Description
7:0	CHANSPC_M[7:0]	248 (0xF8)	R/W	<p>8-bit mantissa of channel spacing. The channel spacing is multiplied by the channel number CHAN and added to the base frequency. It is unsigned and has the format:</p> $R_{DATA} = \frac{(256 + DRATE_M) \cdot 2^{DRATE_E}}{2^{28}} \cdot f_{XOSC}$ <p>The default values give 199.951 kHz channel spacing (the closest setting to 200 kHz), assuming 26.0 MHz crystal frequency.</p>

Table 5-44. 0x15: DEVIATN - Modem Deviation Setting

Bit	Field Name	Reset	R/W	Description	
7			R0	Not used.	
6:4	DEVIATION_E[2:0]	4 (100)	R/W	Deviation exponent.	
3			R0	Not used.	
2:0	DEVIATION_M[2:0]	7 (111)	R/W	RX	
				2-FSK/GFSK/4-FSK	Specifies the expected frequency deviation of incoming signal, must be approximately right for demodulation to be performed reliably and robustly.
				OOK	This setting has no effect.
				TX	
				2-FSK/GFSK/4-FSK	<p>Specifies the nominal frequency deviation from the carrier for a '0' (-DEVIATN) and '1' (+DEVIATN) in a mantissa- exponent format, interpreted as a 4-bit value with MSB implicit 1. The resulting frequency deviation is given by:</p> $\Delta f_{CHANNEL} = \frac{f_{XOSC}}{2^{18}} \cdot (256 + CHANSPC_M) \cdot 2^{CHANSPC_E}$ <p>The default values give ±47.607 kHz deviation assuming 26.0 MHz crystal frequency.</p>
OOK	This setting has no effect				

Table 5-45. 0x16: MCSM2 - Main Radio Control State Machine Configuration

Bit	Field Name	Reset	R/W	Description
7:5			R0	Not used
4	RX_TIME_RSSI	0	R/W	Direct RX termination based on RSSI measurement (carrier sense). For OOK modulation, RX times out if there is no carrier sense in the first 8 symbol periods.
3:0		7 (0111)	R/W	Use setting from SmartRF Studio

Table 5-46. 0x17: MCSM1 - Main Radio Control State Machine Configuration

Bit	Field Name	Reset	R/W	Description	
7:6			R0	Not used	
5:4	CCA_MODE	3 (11)	R/W	Selects CCA_MODE; Reflected in CCA signal	
				Setting	Clear channel indication
				0 (00)	Always
				1 (01)	If RSSI below threshold
				2 (10)	Unless currently receiving a packet
3:2	RXOFF_MODE[1:0]	0 (00)	R/W	Select what should happen when a packet has been received.	
				Setting	Next state after finishing packet reception
				0 (00)	IDLE
				1 (01)	FSTXON
				2 (10)	TX
1:0	TXOFF_MODE[1:0]	0 (00)	R/W	Select what should happen when a packet has been sent	
				Setting	Next state after finishing packet transmission
				0 (00)	IDLE
				1 (01)	FSTXON
				2 (10)	Stay in TX (start sending preamble)
				3 (11)	RX

Table 5-47. 0x18: MCSM0 - Main Radio Control State Machine Configuration

Bit	Field Name	Reset	R/W	Description		
7:6			R0	Not used		
5:4	FS_AUTOCAL[1:0]	0 (00)	R/W	Automatically calibrate when going to RX or TX, or back to IDLE		
				Setting	When to perform automatic calibration	
				0 (00)	Never (manually calibrate using SCAL strobe)	
				1 (01)	When going from IDLE to RX or TX (or FSTXON)	
				2 (10)	When going from RX or TX back to IDLE automatically	
3 (11)	Every 4th time when going from RX or TX to IDLE automatically					
3:2	PO_TIMEOUT	1 (01)	R/W	Programs the number of times the six-bit ripple counter must expire after the XOSC has settled before CHP_RDYn goes low. ⁽¹⁾ If XOSC is on (stable) during power-down, PO_TIMEOUT shall be set so that the regulated digital supply voltage has time to stabilize before CHP_RDYn goes low (PO_TIMEOUT=2 recommended). Typical start-up time for the voltage regulator is 50 μ s. For robust operation it is recommended to use PO_TIMEOUT = 2 or 3 when XOSC is off during power-down.		
				Setting	Expire count	Timeout after XOSC start
				0 (00)	1	Approximately 2.3 - 2.4 μ s
				1 (01)	16	Approximately 37 - 39 μ s
				2 (10)	64	Approximately 149 - 155 μ s
				3 (11)	256	Approximately 597 - 620 μ s
Exact timeout depends on crystal frequency.						
1		0	R/W	Use setting from SmartRF Studio		
0	XOSC_FORCE_ON	0	R/W	Force the XOSC to stay on in the SLEEP state.		

(1) Note that the XOSC_STABLE signal will be asserted at the same time as the CHIP_RDYn signal; that is, the PO_TIMEOUT delays both signals and does not insert a delay between the signals.

Table 5-48. 0x19: FOCCFG - Frequency Offset Compensation Configuration

Bit	Field Name	Reset	R/W	Description	
7:6			R0	Not used	
5	FOC_BS_CS_GATE	1	R/W	If set, the demodulator freezes the frequency offset compensation and clock recovery feedback loops until the CS signal goes high.	
4:3	FOC_PRE_K[1:0]	2 (10)	R/W	The frequency compensation loop gain to be used before a sync word is detected.	
				Setting	Freq. compensation loop gain before sync word
				0 (00)	K
				1 (01)	2K
				2 (10)	3K
3 (11)	4K				

Table 5-48. 0x19: FOCCFG - Frequency Offset Compensation Configuration (continued)

Bit	Field Name	Reset	R/W	Description	
2	FOC_POST_K	1	R/W	The frequency compensation loop gain to be used after a sync word is detected.	
				Setting	Freq. compensation loop gain after sync word
				0	Same as FOC_PRE_K
				1	$K/2$
1:0	FOC_LIMIT[1:0]	2 (10)	R/W	The saturation point for the frequency offset compensation algorithm:	
				Setting	Saturation point (max compensated offset)
				0 (00)	± 0 (no frequency offset compensation)
				1 (01)	$\pm BW_{CHAN}/8$
				2 (10)	$\pm BW_{CHAN}/4$
				3 (11)	$\pm BW_{CHAN}/2$
				Frequency offset compensation is not supported for OOK. Always use FOC_LIMIT=0 with this modulation format.	

Table 5-49. 0x1A: BSCFG - Bit Synchronization Configuration

Bit	Field Name	Reset	R/W	Description	
7:6	BS_PRE_KI[1:0]	1 (01)	R/W	The clock recovery feedback loop integral gain to be used before a sync word is detected (used to correct offsets in data rate):	
				Setting	Clock recovery loop integral gain before sync word
				0 (00)	K_I
				1 (01)	$2K_I$
				2 (10)	$3K_I$
5:4	BS_PRE_KP[1:0]	2 (10)	R/W	The clock recovery feedback loop proportional gain to be used before a sync word is detected.	
				Setting	Clock recovery loop proportional gain before sync word
				0 (00)	K_P
				1 (01)	$2K_P$
				2 (10)	$3K_P$
3	BS_POST_KI	1	R/W	The clock recovery feedback loop integral gain to be used after a sync word is detected.	
				Setting	Clock recovery loop integral gain after sync word
				0	Same as BS_PRE_KI
				1	$K_I / 2$
2	BS_POST_KP	1	R/W	The clock recovery feedback loop proportional gain to be used after a sync word is detected.	
				Setting	Clock recovery loop proportional gain after sync word
				0	Same as BS_PRE_KP
				1	K_P

Table 5-49. 0x1A: BSCFG - Bit Synchronization Configuration (continued)

Bit	Field Name	Reset	R/W	Description	
1:0	BS_LIMIT[1:0]	0 (00)	R/W	The saturation point for the data rate offset compensation algorithm:	
				Setting	Data rate offset saturation (max data rate difference)
				0 (00)	±0 (No data rate offset compensation performed)
				1 (01)	±3.125 % data rate offset
				2 (10)	±6.25 % data rate offset
				3 (11)	±12.5 % data rate offset

Table 5-50. 0x1B: AGCCTRL2 - AGC Control

Bit	Field Name	Reset	R/W	Description	
7:6	MAX_DVGA_GAIN[1:0]	0 (00)	R/W	Reduces the maximum allowable DVGA gain.	
				Setting	Allowable DVGA settings
				0 (00)	All gain settings can be used
				1 (01)	The highest gain setting cannot be used
				2 (10)	The 2 highest gain settings cannot be used
				3 (11)	The 3 highest gain settings cannot be used
5:3	MAX_LNA_GAIN[2:0]	0 (000)	R/W	Sets the maximum allowable LNA + LNA 2 gain relative to the maximum possible gain.	
				Setting	Maximum allowable LNA + LNA 2 gain
				0 (000)	Maximum possible LNA + LNA 2 gain
				1 (001)	Approximately 2.6 dB below maximum possible gain
				2 (010)	Approximately 6.1 dB below maximum possible gain
				3 (011)	Approximately 7.4 dB below maximum possible gain
				4 (100)	Approximately 9.2 dB below maximum possible gain
				5 (101)	Approximately 11.5 dB below maximum possible gain
				6 (110)	Approximately 14.6 dB below maximum possible gain
7 (111)	Approximately 17.1 dB below maximum possible gain				
2:0	MAGN_TARGET[2:0]	3 (011)	R/W	These bits set the target value for the averaged amplitude from the digital channel filter (1 LSB = 0 dB).	
				Setting	Target amplitude from channel filter
				0 (000)	24 dB
				1 (001)	27 dB
				2 (010)	30 dB
				3 (011)	33 dB
				4 (100)	36 dB
				5 (101)	38 dB
				6 (110)	40 dB
7 (111)	42 dB				

Table 5-51. 0x1C: AGCCTRL1 - AGC Control

Bit	Field Name	Reset	R/W	Description	
7			R0	Not used	
6	AGC_LNA_PRIORITY	1	R/W	Selects between two different strategies for LNA and LNA 2 gain adjustment. When 1, the LNA gain is decreased first. When 0, the LNA 2 gain is decreased to minimum before decreasing LNA gain.	
5:4	CARRIER_SENSE_REL_THR[1:0]	0 (00)	R/W	Sets the relative change threshold for asserting carrier sense	
				Setting	Carrier sense relative threshold
				0 (00)	Relative carrier sense threshold disabled
				1 (01)	6 dB increase in RSSI value
				2 (10)	10 dB increase in RSSI value
3 (11)	14 dB increase in RSSI value				
3:0	CARRIER_SENSE_ABS_THR[3:0]	0 (0000)	R/W	Sets the absolute RSSI threshold for asserting carrier sense. The 2-complement signed threshold is programmed in steps of 1 dB and is relative to the MAGN_TARGET setting.	
				Setting	Carrier sense absolute threshold (Equal to channel filter amplitude when AGC has not decreased gain)
				-8 (1000)	Absolute carrier sense threshold disabled
				-7 (1001)	7 dB below MAGN_TARGET setting
			
				-1 (1111)	1 dB below MAGN_TARGET setting
				0 (0000)	At MAGN_TARGET setting
				1 (0001)	1 dB above MAGN_TARGET setting
			
7 (0111)	7 dB above MAGN_TARGET setting				

Table 5-52. 0x1D: AGCCTRL0 - AGC Control

Bit	Field Name	Reset	R/W	Description	
7:6	HYST_LEVEL[1:0]	2 (10)	R/W	Sets the level of hysteresis on the magnitude deviation (internal AGC signal that determine gain changes).	
				Setting	Description
				0 (00)	No hysteresis, small symmetric dead zone, high gain
				1 (01)	Low hysteresis, small asymmetric dead zone, medium gain
				2 (10)	Medium hysteresis, medium asymmetric dead zone, medium gain
3 (11)	Large hysteresis, large asymmetric dead zone, low gain				
5:4	WAIT_TIME[1:0]	1 (01)	R/W	Sets the number of channel filter samples from a gain adjustment has been made until the AGC algorithm starts accumulating new samples.	
				Setting	Channel filter samples
				0 (00)	8
				1 (01)	16
				2 (10)	24
3 (11)	32				

Table 5-52. 0x1D: AGCTRL0 - AGC Control (continued)

Bit	Field Name	Reset	R/W	Description		
3:2	AGC_FREEZE[1:0]	0 (00)	R/W	Control when the AGC gain should be frozen.		
				Setting	Function	
				0 (00)	Normal operation. Always adjust gain when required.	
				1 (01)	The gain setting is frozen when a sync word has been found.	
				2 (10)	Manually freeze the analogue gain setting and continue to adjust the digital gain.	
3 (11)	Manually freezes both the analogue and the digital gain setting. Used for manually overriding the gain.					
1:0	FILTER_LENGTH[1:0]	1 (01)	R/W	2-FSK and 4-FSK: Sets the averaging length for the amplitude from the channel filter. OOK: Sets the OOK decision boundary for OOK reception.		
				Setting	Channel filter samples	OOK decision boundary
				0 (00)	8	4 dB
				1 (01)	16	8 dB
				2 (10)	32	12 dB
3 (11)	64	16 dB

7:0	VERSION[7:0]	23 (0x17)	R	Chip version number. Subject to change without notice.

Table 5-68. 0x32 (0xF2): FREQUEST - Frequency Offset Estimate from Demodulator

Bit	Field Name	Reset	R/W	Description
7:0	FREQOFF_EST		R	The estimated frequency offset (2s complement) of the carrier. Resolution is $F_{XTAL}/2^{14}$ (1.59 - 1.65 kHz); range is ± 202 kHz to ± 210 kHz, depending on XTAL frequency. Frequency offset compensation is only supported for 2-FSK, GFSK, and 4-FSK modulation. This register will read 0 when using OOK modulation.

Table 5-69. 0x33 (0xF3): CRC_REG - CRC OK

Bit	Field Name	Reset	R/W	Description
7	CRC OK		R	The last CRC comparison matched. Cleared when entering/restarting RX mode.
6:0			R	Reserved

Table 5-70. 0x34 (0xF4): RSSI - Received Signal Strength Indication

Bit	Field Name	Reset	R/W	Description
7:0	RSSI		R	Received signal strength indicator

Table 5-71. 0x35 (0xF5): MARCSTATE - Main Radio Control State Machine State

Bit	Field Name	Reset	R/W	Description		
7:5			R0	Not used		
4:0	MARC_STATE[4:0]		R	Main Radio Control FSM State		
				Value	State name	State (see Figure 5-11)
				0 (0x00)	SLEEP	SLEEP
				1 (0x01)	IDLE	IDLE
				2 (0x02)	XOFF	XOFF
				3 (0x03)	VCOON_MC	MANCAL
				4 (0x04)	REGON_MC	MANCAL
				5 (0x05)	MANCAL	MANCAL
				6 (0x06)	VCOON	FS_WAKEUP
				7 (0x07)	REGON	FS_WAKEUP
				8 (0x08)	STARTCAL	CALIBRATE
				9 (0x09)	BWBOOST	SETTLING
				10 (0x0A)	FS_LOCK	SETTLING
				11 (0x0B)	IFADCON	SETTLING
				12 (0x0C)	ENDCAL	CALIBRATE
				13 (0x0D)	RX	RX
				14 (0x0E)	RX_END	RX
				15 (0x0F)	RX_RST	RX
				16 (0x10)	TXRX_SWITCH	TXRX_SETTLING
				17 (0x11)	RXFIFO_OVERFLOW	RXFIFO_OVERFLOW
				18 (0x12)	FSTXON	FSTXON
				19 (0x13)	TX	TX
				20 (0x14)	TX_END	TX
21 (0x15)	RXTX_SWITCH	RXTX_SETTLING				
22 (0x16)	TXFIFO_UNDERFLOW	TXFIFO_UNDERFLOW				
				Note: it is not possible to read back the SLEEP or XOFF state numbers because setting CSn low will make the chip enter the IDLE mode from the SLEEP or XOFF states.		

Table 5-72. 0x38 (0xF8): PKTSTATUS - Current GDOx Status and Packet Status

Bit	Field Name	Reset	R/W	Description
7	CRC_OK		R	The last CRC comparison matched. Cleared when entering/restarting RX mode.
6	CS		R	Carrier sense. Cleared when entering IDLE mode.
5				Reserved
4	CCA		R	Channel is clear
3	SFD		R	Start of Frame Delimiter. This bit is asserted when sync word has been received and deasserted at the end of the packet. It will also de-assert when a packet is discarded due to address or maximum length filtering or the radio enters RXFIFO_OVERFLOW state.

Table 5-72. 0x38 (0xF8): PKTSTATUS - Current GDOx Status and Packet Status (continued)

Bit	Field Name	Reset	R/W	Description
2	GDO2		R	Current GDO2 value. Note: the reading gives the non-inverted value irrespective of what <code>IOCFG2.GDO2_INV</code> is programmed to. It is not recommended to check for PLL lock by reading <code>PKTSTATUS[2]</code> with <code>GDO2_CFG=0x0A</code> .
1			R	Not used
0	GDO0		R	Current GDO0 value. Note: the reading gives the non-inverted value irrespective of what <code>IOCFG0.GDO0_INV</code> is programmed to. It is not recommended to check for PLL lock by reading <code>PKTSTATUS[0]</code> with <code>GDO0_CFG=0x0A</code> .

Table 5-73. 0x3A (0xFA): TXBYTES - Underflow and Number of Bytes

Bit	Field Name	Reset	R/W	Description
7	TXFIFO_UNDERFLOW		R	
6:0	NUM_TXBYTES		R	Number of bytes in TX FIFO

Table 5-74. 0x3B (0xFB): RXBYTES - Overflow and Number of Bytes

Bit	Field Name	Reset	R/W	Description
7	RXFIFO_OVERFLOW		R	
6:0	NUM_RXBYTES		R	Number of bytes in RX FIFO

5.29 Development Kit Ordering Information

Orderable Evaluation Module	Description	Minimum Order Quantity
CC11xLDK-868-915	CC11xL Development Kit, 868/915 MHz	1
CC11xLEMK-433	CC11xL Evaluation Module Kit, 433 MHz	1
RF BoosterPack for MSP430 LaunchPad	Plug-in boards for the MSP430 Value Line LaunchPad (MSP-EXP430G2), 868/915 MHz	1

6 Applications, Implementation, and Layout

The low cost application circuits ([SWRR081](#) and [SWRR082](#)), which use multi layer inductors, are shown in [Figure 6-1](#) and [Figure 6-2](#) (see [Table 6-1](#) for component values).

The designs in [SWRR046](#) and [SWRR045](#) were used for CC110L characterization. The 315 MHz and 433 MHz design [SWRR046](#) use inexpensive multi-layer inductors similar to the low cost application circuit while the 868 MHz and 915 MHz design [SWRR045](#) use wire-wound inductors. Wire-wound inductors give better output power and attenuation of harmonics compared to using multi-layer inductors.

Refer to design note DN032 [SWRA346](#) for information about performance when using wire-wound inductors from different vendors. See also Design Note DN013 [SWRA168](#), which gives the output power and harmonics when using multi-layer inductors. The output power is then typically +10 dBm when operating at 868/915 MHz.

6.1 Bias Resistor

The 56-k Ω bias resistor R171 is used to set an accurate bias current.

6.2 Balun and RF Matching

The balun and LC filter component values and their placement are important to keep the performance optimized. Gerber files and schematics for the reference designs are available for download from the TI website.

The components between the RF_N/RF_P pins and the point where the two signals are joined together (C131, C122, L122, and L132 in [Figure 6-1](#) and L121, L131, C121, L122, C131, C122, and L132 in [Figure 6-2](#)) form a balun that converts the differential RF signal on CC110L to a single-ended RF signal. C124 is needed for DC blocking. L123, L124, and C123 (plus C125 in [Figure 6-1](#)) form a low-pass filter for harmonics attenuation.

The balun and LC filter components also matches the CC110L input impedance to a 50- Ω load. C126 provides DC blocking and is only needed if there is a DC path in the antenna. For the application circuit in [Figure 6-2](#), this component may also be used for additional filtering, see [Section 6.5](#).

Figure 6-1. Typical Application and Evaluation Circuit 315 or 433 MHz (Excluding Supply Decoupling Capacitors)

Figure 6-2. Typical Application and Evaluation Circuit 868/915 MHz (Excluding Supply Decoupling Capacitors)

Table 6-1. External Components

Component	Value at 315 MHz	Value at 433 MHz	Value at 868/915 MHz	
			Without C127 and L125	With C127 and L125
C121			1 pF	1 pF
C122	6.8 pF	3.9 pF	1.5 pF	1.5 pF
C123	12 pF	8.2 pF	3.3 pF	3.3 pF
C124	220 pF	220 pF	100 pF	100 pF
C125	6.8 pF	5.6 pF		
C126	220 pF	220 pF	100 pF	12 pF
C127				47 pF
C131	6.8 pF	3.9 pF	1.5 pF	1.5 pF
L121			12 nH	12 nH
L122	33 nH	27 nH	18 nH	18 nH
L123	18 nH	22 nH	12 nH	12 nH
L124	33 nH	27 nH	12 nH	12 nH
L125				3.3 nH
L131			12 nH	12 nH
L132	33 nH	27 nH	18 nH	18 nH

6.3 Crystal

A crystal in the frequency range 26 - 27 MHz must be connected between the XOSC_Q1 and XOSC_Q2 pins. The oscillator is designed for parallel mode operation of the crystal. In addition, loading capacitors (C81 and C101) for the crystal are required. The loading capacitor values depend on the total load capacitance, CL, specified for the crystal. The total load capacitance seen between the crystal terminals should equal CL for the crystal to oscillate at the specified frequency.

$$C_L = \frac{1}{\frac{1}{C_{81}} + \frac{1}{C_{101}}} + C_{\text{parasitic}} \quad (9)$$

The parasitic capacitance is constituted by pin input capacitance and PCB stray capacitance. Total parasitic capacitance is typically 2.5 pF.

The crystal oscillator is amplitude regulated. This means that a high current is used to start up the oscillations. When the amplitude builds up, the current is reduced to what is necessary to maintain approximately 0.4 Vpp signal swing. This ensures a fast start-up, and keeps the drive level to a minimum. The ESR of the crystal should be within the specification in order to ensure a reliable start-up (see [Section 4.9](#)).

The initial tolerance, temperature drift, aging and load pulling should be carefully specified in order to meet the required frequency accuracy in a certain application.

Avoid routing digital signals with sharp edges close to XOSC_Q1 PCB track or underneath the crystal dc operating point and result in duty cycle variation.

For compliance with modulation bandwidth requirements under EN 300 220 V2.3.1 in the 863 to 870 MHz frequency range it is recommended to use a 26 MHz crystal for frequencies below 869 MHz and a 27 MHz crystal for frequencies above 869 MHz.

6.4 Reference Signal

The chip can alternatively be operated with a reference signal from 26 to 27 MHz instead of a crystal. This input clock can either be a full-swing digital signal (0 V to VDD) or a sine wave of maximum 1 V peak-peak amplitude. The reference signal must be connected to the XOSC_Q1 input. The sine wave must be connected to XOSC_Q1 using a serial capacitor. When using a full-swing digital signal, this capacitor can be omitted. The XOSC_Q2 line must be left un-connected. C81 and C101 can be omitted when using a reference signal.

6.5 Additional Filtering

In the 868/915 MHz reference design [SWRR082](#), C127 and L125 together with C126 build an optional filter to reduce emission at carrier frequency - 169 MHz. This filter is necessary for applications with an external antenna connector that seek compliance with ETSI EN 300 220 V2.3.1. For more information, see DN017 [SWRA168](#). If this filtering is not necessary, C126 will work as a DC block (only necessary if there is a DC path in the antenna). C127 and L125 should in that case be left unmounted. Additional external components (that is, an RF SAW filter) may be used in order to improve the performance in specific applications.

6.6 Power Supply Decoupling

The power supply must be properly decoupled close to the supply pins. Note that decoupling capacitors are not shown in the application circuit. The placement and the size of the decoupling capacitors are very important to achieve the optimum performance ([SWRR081](#) and [SWRR082](#) should be followed closely).

6.7 PCB Layout Recommendations

The top layer should be used for signal routing, and the open areas should be filled with metallization connected to ground using several vias.

The area under the chip is used for grounding and shall be connected to the bottom ground plane with several vias for good thermal performance and sufficiently low inductance to ground.

In [SWRR081](#) and [SWRR082](#), 5 vias are placed inside the exposed die attached pad. These vias should be “tented” (covered with solder mask) on the component side of the PCB to avoid migration of solder through the vias during the solder reflow process.

The solder paste coverage should not be 100%. If it is, out gassing may occur during the reflow process, which may cause defects (splattering, solder balling). Using “tented” vias reduces the solder paste coverage below 100%. See [Figure 6-3](#) for top solder resist and top paste masks.

Each decoupling capacitor should be placed as close as possible to the supply pin it is supposed to decouple. Each decoupling capacitor should be connected to the power line (or power plane) by separate vias. The best routing is from the power line (or power plane) to the decoupling capacitor and then to the CC110L supply pin. Supply power filtering is very important.

Each decoupling capacitor ground pad should be connected to the ground plane by separate vias. Direct connections between neighboring power pins will increase noise coupling and should be avoided unless absolutely necessary. Routing in the ground plane underneath the chip or the balun/RF matching circuit, or between the chip's ground vias and the decoupling capacitor's ground vias should be avoided. This improves the grounding and ensures the shortest possible current return path.

Avoid routing digital signals with sharp edges close to XOSC_Q1 PCB track or underneath the crystal Q1 pad as this may shift the crystal dc operating point and result in duty cycle variation.

The external components should ideally be as small as possible (0402 is recommended) and surface mount devices are highly recommended. Components with different sizes than those specified may have differing characteristics.

Precaution should be used when placing the microcontroller in order to avoid noise interfering with the RF circuitry.

A CC11xL Development Kit with a fully assembled CC110L Evaluation Module is available. It is strongly advised that this reference layout is followed very closely in order to get the best performance. The schematic, BOM and layout Gerber files are all available from the TI website ([SWRR081](#) and [SWRR082](#)).

7 Device and Documentation Support

7.1 Device Support

7.1.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, *CC110L*). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, *RGP*) and the temperature range (for example, blank is the default commercial temperature range).

For orderable part numbers of *CC110L* devices in the *QFN* package types, see the Package Option Addendum of this document, the TI website (www.ti.com), or contact your TI sales representative.

7.2 Documentation Support

7.2.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

[TI E2E™ Online Community](#) *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

[TI Embedded Processors Wiki](#) *Texas Instruments Embedded Processors Wiki*. Established to help developers get started with Embedded Processors from Texas Instruments and to foster innovation and growth of general knowledge about the hardware and software surrounding these devices.

7.3 Trademarks

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

7.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

7.5 Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from Disclosing party under this Agreement, or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

7.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms and definitions.

7.7 Additional Acronyms

Additional acronyms used in this data sheet are described below.

2-FSK	Binary Frequency Shift Keying
ADC	Analog to Digital Converter
AFC	Automatic Frequency Compensation
AGC	Automatic Gain Control
AMR	Automatic Meter Reading
BER	Bit Error Rate
BT	Bandwidth-Time product
CCA	Clear Channel Assessment
CFR	Code of Federal Regulations
CRC	Cyclic Redundancy Check
CS	Carrier Sense
CW	Continuous Wave (Unmodulated Carrier)
DC	Direct Current
DVGA	Digital Variable Gain Amplifier
ESR	Equivalent Series Resistance
FCC	Federal Communications Commission
FHSS	Frequency Hopping Spread Spectrum
FS	Frequency Synthesizer
GFSK	Gaussian shaped Frequency Shift Keying
IF	Intermediate Frequency
I/Q	In-Phase/Quadrature
ISM	Industrial, Scientific, Medical

LC	Inductor-Capacitor
LNA	Low Noise Amplifier
LO	Local Oscillator
LSB	Least Significant Bit
MCU	Microcontroller Unit
MSB	Most Significant Bit
NRZ	Non Return to Zero (Coding)
OOK	On-Off Keying
PA	Power Amplifier
PCB	Printed Circuit Board
PD	Power Down
PER	Packet Error Rate
PLL	Phase Locked Loop
POR	Power-On Reset
PQI	Preamble Quality Indicator
PTAT	Proportional To Absolute Temperature
QLP	Quad Leadless Package
QPSK	Quadrature Phase Shift Keying
RC	Resistor-Capacitor
RF	Radio Frequency
RSSI	Received Signal Strength Indicator
RX	Receive, Receive Mode
SMD	Surface Mount Device
SNR	Signal to Noise Ratio
SPI	Serial Peripheral Interface
SRD	Short Range Devices
T/R	Transmit/Receive
TX	Transmit, Transmit Mode
VCO	Voltage Controlled Oscillator
XOSC	Crystal Oscillator
XTAL	Crystal

8 Mechanical Packaging and Orderable Information

8.1 Packaging Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
CC110LRGPR	ACTIVE	QFN	RGP	20	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	CC110L	Samples
CC110LRGPT	ACTIVE	QFN	RGP	20	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	CC110L	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

RGP (S-PVQFN-N20)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - QFN (Quad Flatpack No-Lead) package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
- Check thermal pad mechanical drawing in the product datasheet for nominal lead length dimensions.

THERMAL PAD MECHANICAL DATA

RGP (S-PVQFN-N20)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

4206346-7/AA 11/13

NOTES: A. All linear dimensions are in millimeters

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
