

Introduction

The purpose of this application note is to describe the evaluation boards for either the HI3026 or HI3026A 8-bit ultra high speed analog to digital converters (ADC). The main difference between the two devices is the maximum conversion speed of 120 MSPS and 140 MSPS respectively. This document will use HI3026 for both devices. The boards are shipped with the device soldered onto the PCB. The evaluation board includes many discrete components along with op amps, buffers, logic level conversion (ECL to TTL and TTL to ECL) and a 10-bit D/A converter for reconstructing the output of the HI3026. After latching the HI3026, input data with a frequency divided clock, the analog signal can be regenerated by a 10-bit high speed D/A converter. The latched data can also be extracted externally via a 24 pin cable connector.

Board Description

The evaluation platform is a two layer board optimized for high frequency operation. The supplies to the board should be low noise clean regulated linear power supplies. To ensure reliable performance, use the recommended operating conditions and never exceed the absolute maximum ratings shown in Table 1 and Table 2.

The signals in and out of the board are defined in the Pin Description table, which details various connectors and their function.

TABLE 1. OPERATING CONDITIONS

	MIN (V)	TYP (V)	MAX (V)

Pin Descriptions

PIN NO.	SYMBOL	I/O	STANDARD I/O LEVEL	CURRENT	DESCRIPTION
CON1	AMP.IN	I	0.95Vp-p		Doubles the analog input signal amplitude using the operational amplifier. The input impedance is 50Ω.
CON2	DIR.IN	I	2.0Vp-p		AC coupling input. suitable for sine waves and other repeating waveforms. The input impedance is 50Ω.
CON3	CLK.IN	I	1.0Vp-0		The HI3026 operates at the PECL level clock using the sine wave-to-PECL conversion circuit. The input impedance is 50Ω.
CON4	P1 Side OUT	O	0 to -1V		Allows the D/A converted waveform of the HI3026, port 1 side data to be observed. The output impedance is 50Ω.
CON5	P2 Side OUT	O	0 to -1V		Allows the D/A converted waveform of the HI3026, port 2 side data to be observed. The output impedance is 50Ω.
	V _{CC}	I	5.0V	0.8A	The inside of the board is divided into analog and digital systems.
	GND	I	0V		
	V _{EE}	I	-5.0V	-0.6A	
	+AMP	I	5.0V	40mA	+ side power supply for the operation amplifier.
	-AMP	I	-5.0V	-40mA	- side power supply for the operation amplifier.
CON7	P1 side DATA	O	TTL		The HI3026, port 1 side data output is latched at the frequency divided clock and then output.
CON8	P2 side DATA	O	TTL		The HI3026, port side data output is latched at the frequency divided clock and then output.

Board Adjustments and Settings

1. VRB.R1: HI3026, VRB voltage adjusting volume.
2. VRT.R2: HI3026, VRT voltage adjusting volume.
3. OFFSET.R3: Adjusting volume for matching the AMP.IN input and DIR.IN input signal ranges to the HI3026, input range.
4. FULL SCALE.R4: Full-scale adjusting volume for the port 1 D/A output. (-1V: Typ.)
5. FULL SCALE.R5: Full-scale adjusting volume for the port 2 D/A output. (-1V: Typ.)
6. S1: Switching junction for the dual analog input pins.
Set as follows according to the input pins used.

SYMBOL \ JUNCTION	JUNCTION	
	A	B
AMP.IN	OPEN	SHORT
DIR.IN	0.1μF	10kΩ

7. S2: Setting junction for the clock frequency division ratio. The operating speed after latching is determined by the frequency division ratio set here.
When set to CLK OUT, it operates according to the HI3026, clock output.
8. SW1 SELECT: HI3026, output mode selector switch.
9. SW2 A/D INV: HI3026, output polarity inversion switch.
10. SW# D/A INV: D/A converter output polarity inversion switch.

Notes on Board Operation

1. The factory settings for the HI3026, Evaluation Board are as follows:

VRB.R1 = 1.5V	FULL SCALE.R4 = -1V	S1 A---OPEN, B ---SHORT S2 8---SHORT (1/8 frequency division)
VRT.R2 = 3.0V	FULL SCALE.R5 = -1V	
OFFSET.R3 = 2.25V		

When using the board in this condition, the input signals should be input at the amplitudes shown below.
(The frequency is set as desired.)

2. When the analog signal is input from the CON1 (AMP.IN) pin, IC2:CLC404 limits the input dynamic range of the A/D converter's analog input signal according to the +AMP and -AMP supply voltages. The power supply for the operational amplifier can also be shifted to +AMP = +7.0V and -AMP = -3.0V to allow use with a wider input dynamic range.

3. When the analog input signal is a sine wave or other repeating waveform, the signal can be input from the CON2 (DIR.IN) pin with AC coupling. In these cases, the input dynamic range is not limited by the +AMP and -AMP supply voltages, but the VRT level may be limited by IC3:NJM3403A. Therefore, the power supply for the operational amplifier should be shifted in the same manner as in 2. above.
4. In the evaluation board of the HI3026, CLC404 (Comlinear) is employed for IC2 to drive the analog input signal. Though, CLC505 (Comlinear) can also be used instead of CLC404, there should be little change in the peripheral circuit in this case.
