NLAS8252

DP3T Switch for USB/UART/Data Multiplexing

ON Semiconductor®

Brief Description

The NLAS8252 is a DP3T switch for combined UART and USB 2.0 full speed data applications. It allows portable systems to use a single external port to transmit and receive signals to and from three separate locations within the portable system. It is comprised of two switches, each with a single common I/O that alternates between 3 terminals. They are operated together to allow three data sources, such as a USB or UART transceiver, to pass differential data through a shared USB connector port.

The NLAS8252 features low R_{ON}− 4 Ω (max) at 4.2 V V_{CC}, 5 Ω (typ) at a 3.3 V V_{CC}. It also features low C_{ON}, < 30 pF (max) across the supply voltage range. This performance makes it ideal for USB full speed applications that require both low R_{ON} and C_{ON} for effective signal transmission.

The NLAS8252 is capable of accepting control input signals down to 1.4 V, over a range of V_{CC} supply voltages with minimal leakage current. The NLAS8252 is offered in a lead−free, 12 pin, 1.7 x 2.0 x 0.5 mm, UQFN package.

Features

- R_{ON}: 4 Ω Max @ V_{CC} = 4.2 V
- C_{ON}: < 20 pF @ V_{CC} = 3.3 V
- OVT Protection up to 5.25 V on Common Pins
- V_{CC} Range: 1.65 V to 4.5 V
- 3 kV ESD Protection
- 1.7 x 2.0 x 0.5 mm UQFN12 Package
- This is a Pb−Free Device

Typical Applications

- USB/UART/Data Multiplexing
- Shared USB Connector
- Mobile Phones
- Portable Devices

Detailed Description

The NLAS8252 is a DP3T switch designed for applications where a single USB connector is used for multiple data applications within a portable system. Two differential signals from a USB connector can be routed to 3 different end locations. The first, channel 1, is optimized for a full speed, USB 2.0 transceiver. The second and third, channels 2 and 3, are optimized for UART or remote data applications.

Control Inputs Select Logic

The NLAS8252 is made up of two, 3−throw switches operating off of the same internal enable signal. For each switch, a signal can pass from the common pin to any of three terminals. Whenever COM1 is closed to terminal 1S2, COM2 will respectively be closed to terminal 2S2. The select logic is controlled by two inputs, IN1 and IN2, connecting the common pins to the terminals according to the function table found on page 2. Since there are four possible control states but only 3 possible terminals, the first combination results in a open connection for all three terminals.
