## 700MHz to 2700MHz Analog VGA with Threshold Alarm Circuit and Error Amplifier for Level Control

### General Description

The MAX2092 high-linearity analog variable-gain amplifier (VGA) is a monolithic SiGe BiCMOS attenuator/amplifier/error amplifier with an alarm circuit designed to interface with 50 $\Omega$  systems operating in the 700MHz to 2700MHz frequency range. The device features a gain range of +18.1dB to -22.3dB, a noise figure of 5.2dB, OIP3 linearity of +32.5dBm, and a wide RF bandwidth. Each of these features makes the device an ideal VGA for numerous receiver and transmitter applications. When paired with the MAX2091 or MAX2091B variable gain upconverter, a complete 2-chip IF-RF signal conditioning solution is possible for microwave point-to-point transmitters.

The MAX2092 operates from a single +5V supply, and is available in a compact 20-pin TQFN package (5mm x 5mm) with an exposed pad. Electrical performance is guaranteed over the extended temperature range from T<sub>C</sub> = -40°C to +95°C.

### Applications

Microwave Point-to-Point Receivers and Transmitters  
RF Variable-Gain Stages  
Temperature Compensation Circuits  
Cellular Applications  
WiMAX® Applications  
LTE Applications  
Fixed Broadband Wireless Access  
Wireless Local Loop  
Military Systems

*WiMAX is a registered certification mark and registered service mark of WiMAX Forum.*

### Features

- ◆ **Wide Band Coverage**
  - ✧ 700MHz to 2700MHz RF Frequency Range
- ◆ **High Linearity**
  - ✧ +32.5dBm OIP3
  - ✧ +18.2dBm Output -1dB Compression Point
- ◆ **18.1dB Gain**
- ◆ **40.4dB Attenuation Range**
- ◆ **5.2dB Noise Figure (Includes Attenuator Insertion Loss)**
- ◆ **0.03dB Gain Variation over 100MHz Bandwidth at 1835MHz**
- ◆ **Analog Attenuator Controlled with External Voltage**
- ◆ **Extended +4.75V to +5.8V Supply Range**
- ◆ **Lead(Pb)-Free Package**
- ◆ **Power-Down Capabilities**

[Ordering Information](#) appears at end of data sheet.

## 700MHz to 2700MHz Analog VGA with Threshold Alarm Circuit and Error Amplifier for Level Control

### ABSOLUTE MAXIMUM RATINGS

V<sub>CC\_RF</sub>, V<sub>CC\_A</sub> ..... -0.3V to +6V  
 RF\_OUT, RF\_IN ..... -0.3V to (V<sub>CC</sub> + 0.3V)  
 R\_BIAS, CTRL1, CTRL2,  
 PLVLSET, DET\_VIN ... -0.3V to Minimum (V<sub>CC</sub> + 0.3V, +3.6V)  
 RF\_IN Input Power ..... +15dBm  
 RF\_OUT Output Power ..... +23dBm  
 Continuous Power Dissipation (Note 1) ..... 2.5W

Operating Case Temperature  
 Range (Note 2) ..... -40°C to +95°C  
 Maximum Junction Temperature ..... +150°C  
 Storage Temperature Range ..... -65°C to +150°C  
 Lead Temperature (soldering, 10s) ..... +300°C  
 Soldering Temperature (reflow) ..... +260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note 1:** Based on junction temperature  $T_J = T_C + (\theta_{JC} \times V_{CC} \times I_{CC})$ . This formula can be used when the temperature of the exposed pad is known while the device is soldered down to a PCB. See the *Applications Information* section for details. The junction temperature must not exceed +150°C.

**Note 2:** T<sub>C</sub> is the temperature on the exposed pad of the package. T<sub>A</sub> is the ambient temperature of the device and PCB.

### PACKAGE THERMAL CHARACTERISTICS

Junction-to-Ambient Thermal Resistance (θ<sub>JA</sub>)  
 (Notes 3, 4) ..... 32°C/W

Junction-to-Case Thermal Resistance (θ<sub>JC</sub>)  
 (Notes 1, 4) ..... 7°C/W

**Note 3:** Junction temperature  $T_J = T_A + (\theta_{JA} \times V_{CC} \times I_{CC})$ . This formula can be used when the ambient temperature of the PCB is known. The junction temperature must not exceed +150°C.

**Note 4:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maxim-ic.com/thermal-tutorial](http://www.maxim-ic.com/thermal-tutorial).

### DC ELECTRICAL CHARACTERISTICS

(Typical Application Circuit with V<sub>CC</sub> = 4.75V to 5.8V, V<sub>GND</sub> = 0V, and T<sub>C</sub> = -40°C to +95°C. Typical values are at V<sub>CC</sub> = 5.5V and T<sub>C</sub> = +25°C, unless otherwise noted.) (Note 5)

# MAX2092

## 700MHz to 2700MHz Analog VGA with Threshold Alarm Circuit and Error Amplifier for Level Control

### Pin Configuration

### Pin Description

PIN	NAME	FUNCTION
1	CTRL1	Control-Mode Logic Input 1 (3.3V Logic)
2	R_BIAS	Bias Resistor Setting Input. Connect a resistor from this pin to ground.
3	V <sub>CC_A</sub>	Power-Supply Input. Bypass to ground with a 0.01μF capacitor as close as possible to the pin.
4	PLVLSET	Output-Power Level-Setting DC Input or Analog Attenuator Control Voltage
5	ALM	Alarm Logic Output
6	AMP_OUT	Error-Amplifier Output
7, 13-19	GND	Ground
8	DET_VIN	Error-Amplifier Input Voltage from an External Detector
9	GND	<b>Do not directly connect to EP.</b> Connect to RF ground plane with a short trace using a separate via hole.
10	CTRL2	Control-Mode Logic Input 2 (3.3V Logic)
11	V <sub>CC_RF</sub>	Driver-Amplifier Supply Voltage Input. Bypass to ground with a 0.01μF capacitor as close as possible to the pin.
12	RF_OUT	Driver-Amplifier Output (50Ω). Requires a DC-blocking capacitor.
20	RF_IN	Attenuator Input (50Ω). Requires a DC-blocking capacitor.
—	EP	Exposed Pad. Internally connected to GND. Solder the exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple via grounds are also required to achieve the noted RF performance. See the <i>Layout Considerations</i> section.

## 700MHz to 2700MHz Analog VGA with Threshold Alarm Circuit and Error Amplifier for Level Control

### Detailed Description

The MAX2092 is a high-linearity analog VGA designed to interface with 50Ω systems operating in the 700MHz to 2700MHz frequency range. The analog attenuator is controlled by an external analog control voltage. The device features a gain range of 18.1dB to -22.3dB, a noise figure of 5.2dB, OIP3 linearity of +32.5dBm, and a wide RF bandwidth. Each of these features makes the device an ideal VGA for numerous receiver and transmitter applications. In addition, the device operates from a single +5V supply.

### Applications Information

#### Modes of Operation

The device can operate in several different modes, as summarized in Table 1.

#### VGA-Only Mode Operation

VGA-only mode operation consists of setting CTRL1 = logic 1 and CTRL2 = logic 0, and applying a DC value to PLVLSET between 0V and 2.5V DC to manually adjust the attenuation, and subsequently the RF\_OUT power to any desired value. The output power at RF\_OUT increases at a rate of 19.4dB/V as PLVLSET is increased. In VGA-only mode, operation components R5, R6, R7, and C8–C11 can be left unpopulated, and CTRL2 needs to be tied directly to ground.

#### Closed-ALC Mode Operation

Closed-ALC mode operation consists of setting CTRL1 = CTRL2 = logic 1. The voltage on PLVLSET is set externally to adjust output power from -20dBm to +5dBm when input power is in the recommended power range, typically -6dBm. See the *Typical Application Circuit*. As PLVLSET increases, the output power also increases at a rate set by the external detector chosen. Ideally, a detector with an output voltage range of 0.1V DC to 2.4V DC is

recommended, but the device operates with any detector whose output ranges from 0V DC to 2.5V DC (output coupler at RF\_OUT already taken into account). An error amplifier compares the DET\_VIN voltage to PLVLSET, and drives the attenuator in servo fashion until the error-amplifier's differential input error voltage is near zero. The servo loop acts to maintain a regulated output power level over an input power range depending on the setting of PLVLSET.

When used in conjunction with the MAX2091 IF VGA, it is recommended that an external voltage of 1.65V be applied to the IF PLVLSET. This ensures that a nominal RF signal level of approximately -3dBm is output from the MAX2091. With this specific level setting, the complete MAX2091 + MAX2092 cascade yields a constant RF output power of -20.5dBm to +5dBm (depending on the setting of RF PLVLSET) over an IF input power range of -24dBm to +1dBm. See Figure 1 for details. Contact the factory for additional details surrounding Maxim's MAX2091 + MAX2092 reference design.

#### Control Inputs

The device has three control inputs: CTRL1, CTRL2, and PLVLSET. V<sub>CC</sub> must be present before voltages are applied to these pins. In cases where this is not possible, a 200Ω resistor must be included in series with the control inputs to limit on-chip ESD diode conduction. CTRL1 and CTRL2 are 3V logic controls, and cannot be driven from 5V logic. In the case where no logic control is available and a logic high is required, a voltage divider can be used from the 5V V<sub>CC</sub> supply to produce the 3V logic-high.

#### Alarm Operation

The alarm remains in logic-high state when the voltage on DET\_VIN (pin 8) is within the 0.175V to 2.25V range. The alarm threshold amount is an internal fixed value to the device with a nominal hysteresis of approximately 29mV.

**Table 1. Control Mode Logic**

CTRL1	CTRL2	VGA	ALC LOOP	ALARM	FUNCTIONAL DESCRIPTION
0	0	Disabled	Disabled	Disabled	Power-Down Mode
1	0	Enabled	Disabled	Disabled	VGA-Only Mode
1	1	Enabled	Enabled	Enabled	Closed ALC Mode. ALC loop locks DET_VIN to PLVLSET.
0	1	—	—	—	Factory Test Mode (Do Not Use)

## 700MHz to 2700MHz Analog VGA with Threshold Alarm Circuit and Error Amplifier for Level Control

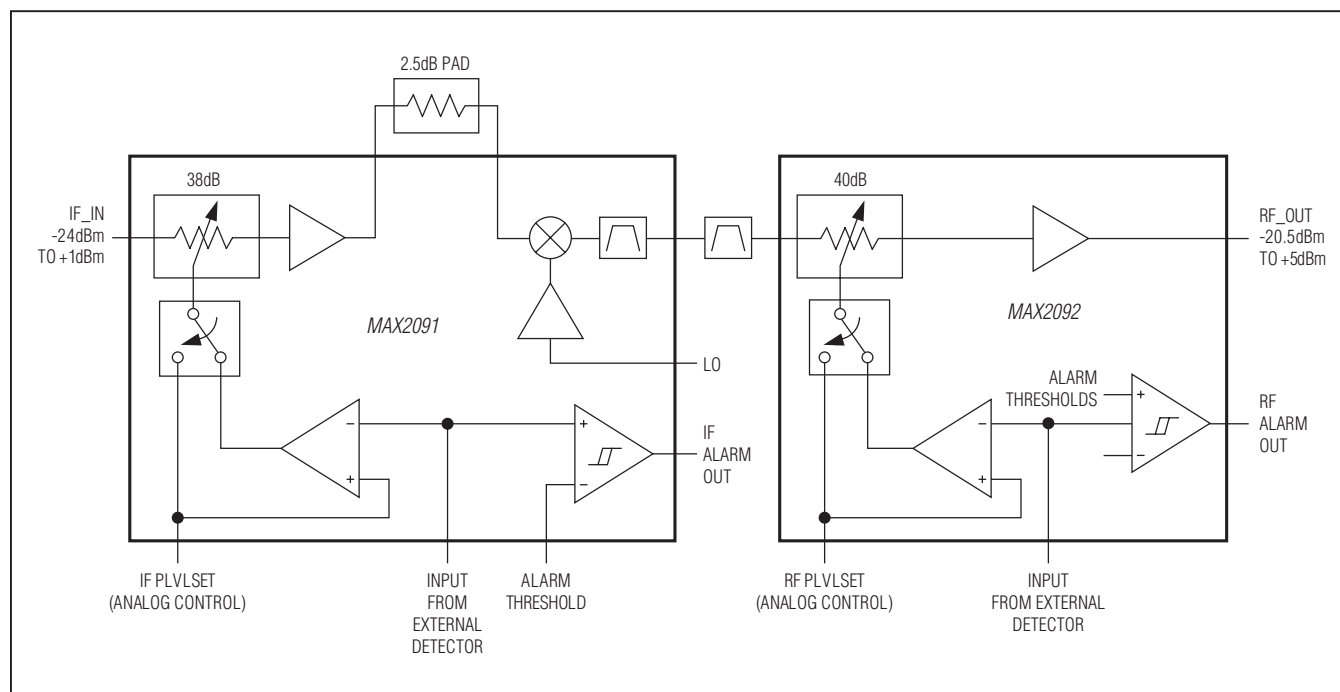

Figure 1. Cascaded IF-RF Lineup Using the MAX2091 + MAX2092

### DET\_VIN

In closed ALC-loop mode, avoid directly loading pins AMP\_OUT and DET\_VIN with capacitance in excess of 10pF on each pin. In closed ALC-loop mode, this can cause ringing or instability in the power-control loop. As in any closed-loop system, one must be careful not to load DET\_VIN or AMP\_OUT with additional external circuitry. Therefore, it is suggested that in the closed-loop ALC mode, no additional connections be made to DET\_VIN or AMP\_OUT. AMP\_OUT and DET\_VIN support a total trace routing capacitance of 10pF or less. Connect pin 9 to the RF ground plane with a via separated from the exposed pad (EP) ground connection. Pin 9 must not connect to the exposed pad or share a ground with any other component, and must connect directly to the solid ground plane below. As a reference, refer to the MAX2092EVKIT+ PCB artwork.

### Layout Considerations

The pin configuration of the MAX2092 is optimized to facilitate a very compact physical layout of the device and its associated discrete components. The exposed pad of the device's 20-pin TQFN-EP package provides a low thermal-resistance path to the die. It is important that the PCB on which the device is mounted be designed to conduct heat from the EP. In addition, provide the EP with a low inductance path to electrical ground. The EP **MUST** be soldered to a ground plane on the PCB, either directly or through an array of plated via holes. Pin 9 must not connect to the exposed pad or share a ground with any other component and must connect directly to the solid ground plane below.
