

## **General Description**

The MAX4397DA/SA dual SCART switch matrices route audio and video signals between an MPEG encoder and two external SCART connectors under I<sup>2</sup>C control, and meets the requirements of EN50049-1, IEC 933-1, Canal+, and BSkyB standards.

The video and audio channels feature input source selection multiplexers, input buffers, and output buffers for routing all inputs to selected outputs. The MAX4397DA audio encoder input is differential DC-coupled, while the MAX4397SA audio encoder input is single-ended AC-coupled. Except for the MAX4397DA's audio encoder input, all other inputs and outputs are AC-coupled with internal DC-biasing set to predefined levels.

The MAX4397DA/SA provide programmable gain control from +5dB to +7dB in 1dB steps for Red, Green, and Blue component video signals. All other video outputs have a fixed +6dB gain. Additional features include an internal Luma and Chroma (Y/C) mixer that generates a Composite video signal (CVBS) to supply an RF modulator output and internal video reconstruction lowpass filters with passband ripple between -1dB and +1dB from 100kHz to 5.5MHz. The MAX4397DA/SA TV audio channel feature clickless switching and programmable volume control from -56dB to +6dB in 2dB steps. The VCR audio output also has programmable gain for -6dB, 0dB, or +6dB. The device also generates monaural audio from left and right stereo inputs. All audio drivers deliver a 3.0V<sub>RMS</sub> minimum output.

The MAX4397DA/SA operate with standard 5V and 12V power supplies and support slow-switching and fastswitching signals. The I<sup>2</sup>C interface programs the gain and volume control, and selects the input source for routing.

The MAX4397DA/SA are available in a compact 48-pin thin QFN package and are specified over the 0°C to +70°C commercial temperature range.

## **Applications**

Satellite Set-Top Boxes Cable Set-Top Boxes

TVs

**VCRs** 

**DVDs** 

#### Features

- ♦ Video Outputs Drive 2V<sub>P-P</sub> into 150Ω
- ♦ Audio Outputs Drive 3V<sub>RMS</sub> into 10kΩ
- ♦ Clickless, Popless Audio Gain Control and Switching
- **♦ AC-Coupled Video Inputs with Internal Clamp** and Bias
- ♦ DC-Coupled Video Outputs
- ♦ Composite Video Signal Created Internally from Y/C Inputs
- ♦ Internal Video Reconstruction Filters Provide -40dB at 27MHz
- ◆ Differential (MAX4397DA) or Single-Ended (MAX4397SA) Audio Encoder Input
- ♦ Red/Chroma Switch for Bidirectional I/O
- ♦ I<sup>2</sup>C-Programmable RGB Gain from +5dB to +7dB
- ♦ I<sup>2</sup>C-Programmable Audio Gain Control from +6dB to -56dB
- ♦ Meets EN50049-1, IEC 933-1, Canal+, and BSkyB Requirements

## **Ordering Information**

PART	TEMP RANGE	PIN-PACKAGE	PKG CODE
MAX4397DACTM	0°C to +70°C	48 Thin QFN-EP* (7mm x 7mm)	T4877-6
MAX4397SACTM	0°C to +70°C	48 Thin QFN-EP* (7mm x 7mm)	T4877-6

<sup>\*</sup>EP = Exposed paddle.

Pin Configuration and Typical Application Circuits appear at end of data sheet.

System Block Diagram appears at end of data sheet.

#### **ABSOLUTE MAXIMUM RATINGS**

V <sub>VID</sub> to GNDVID	0.3V to +6V
V <sub>12</sub> to GNDAUD	0.3V to +14V
V <sub>AUD</sub> to GNDAUD	0.3V to +6V
GNDAUD to GNDVID	0.1V to +0.1V
All Video Inputs, ENCIN_FS, VCRIN_FS,	
SET to GNDVID	0.3V to $(V_{VID} + 0.3V)$
All Audio Inputs,	
AUDBIAS to GNDAUD	$-0.3V$ to $(V_{AUD} + 0.3V)$
SDA, SCL, DEV_ADDR to GNDVID	0.3V to +6V
All Audio Outputs, TV_SS,	
VCR_SS to GNDAUD	0.3V to $(V_{12} + 0.3V)$

All Video Outputs, TVOUT_FS to V <sub>VID</sub> , V <sub>AUD</sub> , GNDAUD, GNDVID	Continuous
All Audio Outputs to V <sub>VID</sub> , V <sub>AUD</sub> , V <sub>12</sub> ,	
GNDVID, GNDAUD	Continuous
Continuous Power Dissipation ( $T_A = +70^{\circ}C$ )	
48-Pin Thin QFN (derate 27mW/°C above +70°	°C)2105.3mW
Operating Temperature Range	0°C to +70°C
Junction Temperature	+150°C
Storage Temperature Range	
Lead Temperature (soldering, 10s)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

#### **ELECTRICAL CHARACTERISTICS**

 $(V_{12}=12V, V_{VID}=V_{AUD}=5V, 0.1 \mu F$  X5R capacitor in parallel with a 10  $\mu$ F aluminum electrolytic capacitor from V<sub>AUD</sub> to GNDAUD, V<sub>12</sub> to GNDAUD, and V<sub>VID</sub> to GNDVID, SET = 100  $k\Omega$  nominal, R<sub>LOAD</sub> = 150  $k\Omega$ , T<sub>A</sub> = 0 °C to +70 °C, unless otherwise noted. Typical values are at T<sub>A</sub> = +25 °C.) (Note 1)

## **Pin Description (continued)**

P	IN	NAME	FUNCTION
MAX4397DA	MAX4397SA	NAME	FUNCTION
29	29	RF_CVBS_OUT	RF Modulator Composite Video Output. Internally biased at 1V.
30	30	TV_Y/CVBS_OUT	TV SCART Luma/Composite Video Output. Internally biased at 1V.
31	31	TV_R/C_OUT	TV SCART Red/Chroma Video Output. Internally biased at 1V for Red video signal and 2.2V for Chroma video signal.
32	32	TV_G_OUT	TV SCART Green Video Output. Internally biased at 1V.
33	33	TV_B_OUT	TV SCART Blue Video Output. Internally biased at 1V.
34	34	VCR_Y/CVBS_OUT	VCR SCART Luma/Composite Video Output. Internally biased at 1V.
35	35	VCR_R/C_OUT	VCR SCART Red/Chroma Video Output. Internally biased at 1V for Red video signals and 2.2V for Chroma video signal.
37	37	TV_R/C_IN	TV SCART Red/Chroma Video Input. Internally biased at 1.2V for Red video signals, or 1.9V for Chroma video signals.
38	38	TV_Y/CVBS_IN	TV SCART Luma/Composite Video Input. Internally biased at 1.2V.
39	39	VCR_Y/CVBS_IN	VCR SCART Luma/Composite Video Input. Internally biased at 1.2V.
40	40	VCR_R/C_IN	VCR SCART Red/Chroma Video Input. Internally biased at 1.2V for Red video signals and 1.9V for Chroma video signals.
41	41	VCR_G_IN	VCR SCART Green Video Input. Internally biased at 1.2V.
42	42	VCR_B_IN	VCR SCART Blue Video Input. Internally biased at 1.2V.
43	43	ENC_Y/CVBS_IN	Digital Encoder Luma/Composite Video Input. Internally biased at 1.2V.
44	44	ENC_R/C_IN	Digital Encoder Red/Chroma Video Input. Internally biased at 1.2V for Red video signals, or 1.9V for Chroma video signals.
45	45	ENC_G_IN	Digital Encoder Green Video Input. Internally biased at 1.2V.
46	46	ENC_B_IN	Digital Encoder Blue Video Input. Internally biased at 1.2V.
47	47	ENC_Y_IN	Digital Encoder Luma Video Input. Internally biased at 1.2V.
48	48	ENC_C_IN	Digital Encoder Chroma Video Input. Internally biased at 1.9V.
EP	EP	GNDAUD	Exposed Paddle. Solder to the circuit board ground (GNDAUD) for proper thermal and electrical performance.

## **Detailed Description**

The MAX4397DA/SA are switch matrices that route audio and video signals between different ports using the I<sup>2</sup>C interface. The ports consist of the MPEG decoder output, and two SCART connectors for the TV and VCR. Per EN50049 and IEC 933, the encoder can only input a signal to the SCART connector, while TV and VCR SCART connectors are bidirectional.

The MAX4397DA/SA circuitry consists of four major sections: the video section, the audio section, the slow-and fast-switching section, and the digital interface.

The video section consists of clamp and bias circuitry, input buffers, reconstruction filters, a switch matrix, a Y/C mixer, and output buffers. All video inputs are AC-coupled through a 0.1µF capacitor to set an acceptable DC

level using clamp or bias networks. The bidirectional Red/Chroma outputs can be connected to ground using I<sup>2</sup>C control to make them terminations when Red/Chroma is an input (see the *Video Inputs* section).

The audio section features an input buffer, a switching matrix, volume- or gain-control circuitry, and output drivers. The audio inputs are AC-coupled through a 0.1µF capacitor. Only the audio encoder inputs of the MAX4397DA are different from the MAX4397SA. The MAX4397SA has a single-ended audio encoder input while the audio encoder input for the MAX4397DA is differential. The TV output audio path has volume control from -56dB to +6dB in 2dB steps, while the VCR output audio path has volume control from -6dB to +6dB in 6dB steps. The MAX4397DA/SA can be configured to switch inputs during a zero-crossing function to reduce clicks.

The slow-switching feature allows for bidirectional, trilevel, slow-switching input and output signals at pin VCR\_SS and TV\_SS, respectively. The slow-switching signals from the VCR set the aspect ratio or video source of the TV screen. See the *Slow Switching* section.

Fast switching consists of two inputs from the encoder and VCR, and one output to the TV to insert an onscreen display (OSD). Fast switching is used to route video signals from the VCR or from the encoder to the TV. In addition, the fast-switching output can be configured to a high or low voltage. Fast switching is controlled through the I<sup>2</sup>C interface.

The digital block contains the 2-wire interface circuitry, control, and status registers. The MAX4397DA/SA can be configured through an I<sup>2</sup>C-compatible interface. DEV\_ADDR sets the I<sup>2</sup>C-compatible address.

#### **SCART Video Switching**

The MAX4397DA/SA switch video signals between an MPEG decoder, TV SCART, and VCR SCART. The video switch includes reconstruction filters, multiplexed video amplifiers, and a Y/C mixer driver for an RF modulator. See Figure 1 for the functional diagram of the video section. While the SCART connector supports RGB, S-video, and Composite video formats, RGB, and S-video typically share a bidirectional set of SCART connector pins.

Figure 1. MAX4397DA/SA Video Section Functional Diagram

#### Video Inputs

All video inputs are AC-coupled with an external  $0.1\mu F$  capacitor. Either a clamp or bias circuit sets the DC input level of the video signals. The clamp circuit positions the sync tip of the Composite (CVBS), the Component RGB, or the S-Video Luma signal. If the signal does not have a sync tip, then the clamp positions the minimum of the signal at the clamp voltage. The bias circuitry is used to position the S-video Chroma signal at midlevel of the Luma (Y) signal. On the video inputs that can receive either a Chroma or a Red video signal, the bias or clamp circuit is selected through  $1^2C$ . See Tables 3–12 for loading register details.

The MPEG decoder and VCR uses the RGB format and fast switching to insert an on-screen display (OSD), usually text, onto the TV. The MAX4397DA/SA support RGB as an input from either the VCR or the MPEG decoder and as an output only to the TV. The Red video signal of the RGB format and the Chroma video signal of the S-VHS format share the same SCART connector pin. Therefore, RGB and S-video signals cannot be present at the same time. Loop-through is possible with a Composite video signal but not with RGB signals because the RGB SCART pins are used for both input and output.

In SCART, there is the possibility of a bidirectional use of the Red/Chroma pin. When using the Red/Chroma

pin as an input port, terminate the Red/Chroma output with a  $75\Omega$  resistor to ground. Thus, a ground state is provided by an active pulldown to GNDVID on the Red/Chroma output to support the bidirectional Chroma or Red I/O, turning the output source resistors into terminations (see Figure 2). The active pulldown also provides the "Mute Output" function and disables the deselected video outputs. The "Mute Output" state is the default power-on state for video.

For high-quality home video, the MPEG decoder, VCR, and TV use the S-video format. The MAX4397DA/SA support S-video signals as an input from the VCR, the MPEG decoder, and the TV, and also as a separately switchable output to the TV and VCR. Because S-video support was not included in the original specifications of the SCART connector, the Luma (Y) signal of S-video and the CVBS signal share the same SCART connector pins. If S-video is present, then a Composite signal must be created from the Y and C signals to drive the RF\_CVBS\_OUT pin. For S-video, loop-through is not possible since the Chroma SCART port is used for both input and output.

The MAX4397DA/SA support Composite video (CVBS) format, with inputs from the VCR, MPEG decoder, and TV. Full loop-through is possible to the TV and VCR only since the MPEG decoder SCART connector has separate input and output pins for the CVBS format.

Figure 2. Bidirectional SCART Pins

#### **Video Outputs**

The DC level at the video outputs is controlled so that coupling capacitors are not required, and all of the video outputs are capable of driving a DC-coupled,  $150\Omega$ , back-terminated coax load with respect to ground.

In a typical television input circuit (see Figure 3), the video output driver on the SCART chip only needs to source current. Users should note that, while the SCART specification states  $75\Omega$  impedance, in practice, typical SCART chip implementations assume  $75\Omega$  input resistance to ground (and source current from the video output stage).

Since some televisions and VCRs use the horizontal sync height for automatic gain control, the MAX4397DA/SA accurately reproduce the sync height to within ±2%.

#### **Slow Switching**

The MAX4397DA/SA support the IEC 933-1, Amendment 1, tri-level slow switching that selects the aspect ratio for the display (TV). Under I<sup>2</sup>C-compatible control, the MAX4397DA/SA set the slow-switching output voltage level. Table 1 shows the valid input levels of the slow-switching signal and the corresponding operating modes of the display device.

Two bidirectional ports are available for slow-switching signals for the TV and VCR. The slow-switching input status is continuously read and stored in the register 0Eh. The slow-switching outputs can be set to a logic level or high impedance by writing to registers 07h and 09h. See Tables 8 and 10 for details.

#### Fast Switching

The VCR or MPEG decoder outputs a fast-switching signal to the display device or TV to insert an on-screen display (OSD). The fast-switching signal can also be

Figure 3. Typical TV Input Circuit

set to a constant high or low output signal through the I<sup>2</sup>C interface. The fast-switching output can be set through writing to register 07h.

#### Y/C Mixer

The MAX4397DA/SA include an on-chip mixer to produce Composite video (CVBS) when S-video (Y and C) is present. The Composite video drives the RF\_CVBS\_OUT output pin. The circuit sums Y and C signals to obtain the CVBS component. A +6dB output buffer drives RF\_CVBS\_OUT.

#### **Video Reconstruction Filter**

The encoder DAC outputs need to be lowpass-filtered to reject the out-of-band noise. The MAX4397DA/SA integrate the reconstruction filter. The filter is fourth order, which is composed of two Sallen-Key biquad in cascade, implementing a Butterworth-type transfer function. The internal reconstruction filters feature a 5.5MHz cutoff frequency and -30dB minimum attenuation at 27MHz. Note that the SET pin is used to set the accuracy of the filter cutoff frequency. Connect a  $100 \text{k}\Omega$  resistor from SET to ground.

## **SCART Audio Switching**

#### **Audio Inputs**

All audio inputs for the MAX4397SA are single-ended and AC-coupled. The MAX4397DA audio inputs are singled-ended and AC-coupled except for the audio encoder input, which is differential DC-coupled.

The audio block has three stereo audio inputs from the TV, the VCR, and the MPEG decoder SCART. Each input has a  $100 k\Omega$  resistor connected to an internally generated voltage equal to 0.23 x V12, except for the encoder input of the MAX4397DA, where the DC bias is fixed externally.

Table 1. Slow-Switching Modes

SLOW-SWITCHING SIGNAL VOLTAGE (V)	MODE
0 to 2	Display device uses an internal source such as a built-in tuner to provide a video signal
4.5 to 7.0	Display device uses a video signal from the SCART connector and sets the display to a 16:9 aspect ratio
9.5 to 12.6	Display device uses a signal from the SCART connector and sets the display to a 4:3 aspect ratio

#### **Audio Outputs**

Both right and left channels have a stereo output for the TV and VCR SCART. The monaural output, which is a mix of the TV right and left channels, drives the RF modulator, RF\_MONO\_OUT. The monaural mixer, a resistor summer, attenuates the amplitude of each of the two signals by 6dB. A 12.54dB gain block follows the monaural mixer. If the left and right audio channels

were completely uncorrelated, then a 9.54dB gain block is used. See Figures 4 and 5 for the functional diagram of the audio section.

#### Clickless Switching

The TV channel incorporates a zero-crossing detect (ZCD) circuit that minimizes click noise due to abrupt signal level changes that occur when switching between audio signals at an arbitrary moment.

Figure 4. MAX4397DA Audio Section Functional Diagram

Figure 5. MAX4397SA Audio Section Features Singled-Ended Encoder Input

To implement the zero-crossing function when switching audio signals, set the ZCD bit by loading register 00h through the I<sup>2</sup>C-compatible interface (if the ZCD bit is not already set). Then set the mute bit low by loading register 00h. Next, wait for a sufficient period of time for the audio signal to cross zero. This period is a function of the audio signal path's low-frequency 3dB corner ( $f_{L3dB}$ ). Thus, if  $f_{L3dB} = 1$ kHz, the time period to wait for a zero-crossing detect is  $\frac{1}{2}$ kHz or 0.5ms.

Next, set the appropriate TV switches using register 01h. Finally, clear the mute bit (while leaving the ZCD bit high) using register 00h. The MAX4397DA/SA switch the signal out of mute at the next zero crossing.

To implement the zero-cross function for TV volume changes, or for TV and phono volume bypass switching, simply ensure the ZCD bit in register 00h is set.

#### **Volume Control**

The TV channel volume control ranges from -56dB to +6dB in 2dB steps. The VCR volume control settings are programmable for -6dB, 0dB, and +6dB. These gain levels are referenced to the application inputs, where some dividers are present. With the ZCD bit set, the TV volume control switches only at zero-crossings, thus minimizing click noise. The TV outputs can bypass the volume control. Likewise, the monaural output signal can be processed by the TV volume control or it can bypass the volume control.

## **Digital Section** Serial Interface

The MAX4397DA/SA use a simple 2-wire serial interface requiring only two standard microprocessor port I/O lines. The fast-mode I<sup>2</sup>C-compatible serial interface allows communication at data rates up to 400kbps or 400kHz. Figure 6 shows the timing diagram of the signals on the 2-wire interface.

The two bus lines (SDA and SCL) must be at logic-high when the bus is not in use. The MAX4397DA/SA are slave devices and must be controlled by a master device. Pullup resistors from the bus lines to the supply are required when push-pull circuitry is not driving the lines.

The logic level on the SDA line can only change when the SCL line is low. The start and stop conditions occur when SDA toggles low/high while the SCL line is high (see Figure 6). Data on SDA must be stable for the duration of the setup time (tsu,pat) before SCL goes high. Data on SDA is sampled when SCL toggles high with data on SDA stable for the duration of the hold time (thd,dat). Note that data is transmitted in an 8-bit byte. A total of nine clock cycles are required to transfer a byte to the MAX4397DA/SA. The device acknowledges the successful receipt of the byte by pulling the SDA line low during the 9th clock cycle.

Figure 6. SDA and SCL Signal Timing Diagram

### Data Format of the I<sup>2</sup>C Interface

#### **Write Mode**

s	Slave Address (Write address)	Α	Register Address	Α	Data	Α	Р
---	----------------------------------	---	---------------------	---	------	---	---

#### **Read Mode**

s	Slave Address (Write address)	A	Register Address	Α	Sr	Slave Address (Read address)	A	Data	NA	Р	
---	--	---	---------------------	---	----	---------------------------------------	---	------	----	---	--

S = Start Condition, A = Acknowledge, NA = Not Acknowledge, Sr = Repeat Start Condition, P = Stop Condition

#### I<sup>2</sup>C Compatibility

The MAX4397DA/SA are compatible with existing I<sup>2</sup>C systems. SCL and SDA are high-impedance inputs. SDA has an open drain that pulls the bus line to a logic-low during the 9th clock pulse. Figure 7 shows a typical I<sup>2</sup>C interface application. The communication protocol supports the standard I<sup>2</sup>C 8-bit communications. The MAX4397DA/SA address is compatible with the 7-bit I<sup>2</sup>C addressing protocol only; 10-bit format is not supported.

#### **Digital Inputs and Interface Logic**

The I²C-compatible, 2-wire interface has logic levels defined as  $V_{IL}=0.8V$  and  $V_{IH}=2.0V$ . All of the inputs include Schmitt-trigger buffers to accept low-transition interfaces. The digital inputs are compatible with 3V CMOS logic levels.

Figure 7. Typical I<sup>2</sup>C Interface Application

#### **Programming**

Connect DEV\_ADDR to ground to set the MAX4397DA/SA write and read address as shown in Table 2.

## **Table 2. Slave Address Programming**

ADDRESS PIN STATE	WRITE ADDRESS	READ ADDRESS
V <sub>VID</sub>	96h	97h
GNDVID	94h	95h

#### **Data Register Writing and Reading**

Program the SCART video and audio switches by writing to registers 00h through 0Dh. Registers 00h through 0Eh can also be read, allowing readback of data after programming and facilitating system debugging. The status register is read-only and can be read from address 0Eh. See Tables 3–12 for register programming information.

## Applications Information

#### **Hot Plug of SCART Connectors**

The MAX4397DA/SA feature high-ESD protection on all SCART inputs and outputs, and requires no external transient-voltage suppressor (TVS) devices to protect against floating chassis discharge. Some set-top boxes have a floating chassis problem in which the chassis is not connected to earth ground. As a result, the chassis can charge up to 500V. When a SCART cable is connected to the SCART connector, the charged chassis can discharge through a signal pin. The equivalent circuit is a 2200pF capacitor charged to 311V connected through less than  $0.1\Omega$  to a signal pin. The MAX4397DA/SA are soldered on the PCB when it experiences such a discharge. Therefore, the current spike flows through the ESD protection diodes and is absorbed by the supply bypass capacitors, which have high capacitance and low ESR.

To better protect the MAX4397DA/SA against excess voltages during the cable discharge condition, place an additional 75 $\Omega$  resistor in series with all inputs and outputs to the SCART connector. For harsh environments where  $\pm 15$ kV protection is needed, the MAX4385E and MAX4386E single and quad high-speed op amps feature the industry's first integrated  $\pm 15$ kV ESD protection on video inputs and outputs.

#### **Power Supplies and Bypassing**

The MAX4397DA/SA feature single 5V and 12V supply operation and requires no negative supply. The +12V supply V<sub>12</sub> is for the SCART switching function. For pin V<sub>12</sub>, place all bypass capacitors as close as possible with a 10µF capacitor in parallel with a 0.1µF ceramic capacitor. Connect all V<sub>AUD</sub> pins together to +5V and bypass with a 10µF electrolytic capacitor in parallel with a 0.47µF low-ESR ceramic capacitor to audio ground. Bypass V<sub>AUD</sub> pins with a 0.1µF capacitor to audio ground. Bypass AUD\_BIAS to audio ground with a 10µF electrolytic in parallel with a 0.1µF ceramic capacitor.

Bypass V<sub>DIG</sub> with a 0.1µF ceramic capacitor to digital ground. Bypass each V<sub>VID</sub> to video ground with a 0.1µF ceramic capacitor. Connect V<sub>VID</sub> in series with a 200nH ferrite bead to the +5V supply.

#### **Layout and Grounding**

For optimal performance, use controlled-impedance traces for video signal paths and place input termination resistors and output back-termination resistors close to the MAX4397DA/SA. Avoid routing video traces parallel to high-speed data lines.

The MAX4397DA/SA provide separate ground connections for video, audio, and digital supplies. For best performance, use separate ground planes for each of the ground returns and connect all three ground planes together at a single point. Refer to the MAX4397DA/SA evaluation kit for a proven circuit board layout example.
