

### FEATURES

- 5 kV rms isolated CAN transceiver**
- Integrated V<sub>+</sub> linear regulator**
- Bus side powered by V<sub>+</sub> and V<sub>-</sub>**
- 11 V to 25 V operation on V<sub>+</sub>**
- 5 V or 3.3 V operation on V<sub>DD1</sub>**
- Complies with ISO 11898 standard**
- High speed data rates up to 1 Mbps**
- Short-circuit protection on bus pins**
- Integrated bus miswire protection**
- Unpowered nodes do not disturb the bus**
- 110 or more nodes on the bus**
- Thermal shutdown protection**
- High common-mode transient immunity: >25 kV/μs**
- Safety and regulatory approvals**
  - UL recognition
  - 5000 V<sub>RMS</sub> for 1 minute per UL 1577
  - VDE Certificates of Conformity
  - DIN V VDE V 0884-10 (VDE V 0884-10):2006-12
  - V<sub>IORM</sub> = 846 V peak
- Industrial operating temperature range: -40°C to +85°C**
- Wide body, 16-lead SOIC package**

### APPLICATIONS

- CAN data buses
- Industrial field networks
- DeviceNet applications

### GENERAL DESCRIPTION

The ADM3052 is an isolated controller area network (CAN) physical layer transceiver with a V<sub>+</sub> integrated linear regulator. The ADM3052 complies with the ISO 11898 standard.

The device employs Analog Devices, Inc., iCoupler® technology to combine a 3-channel isolator, a CAN transceiver, and a linear regulator into a single package. The power is isolated between a single 3.3 V or 5 V supply on V<sub>DD1</sub>, the logic side, and a single 24 V supply provided on V<sub>+</sub>, the bus side.

The ADM3052 creates an isolated interface between the CAN protocol controller and the physical layer bus. It is capable of running at data rates up to 1 Mbps.

The device has integrated miswire protection on the bus pins, V<sub>+</sub>, V<sub>-</sub>, CANH, and CANL.

The device has current-limiting and thermal shutdown features to protect against output short circuits and situations where the bus may be shorted to ground or power terminals. The part is fully specified over the industrial temperature range and is available in a 16-lead, wide-body SOIC package.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

**NOTES**  
1. NC = NO CONNECT. DO NOT CONNECT TO THIS PIN.

09292-906

Figure 2. Pin Configuration

Table 7. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	NC	No Connect. Do not connect to this pin.
2	GND <sub>1</sub>	Ground (Logic Side).
3	GND <sub>1</sub>	Ground (Logic Side).
4	V <sub>+SENSE</sub>	Bus Voltage Sense. A low level on V <sub>+SENSE</sub> indicates that there is power connected on the bus on V <sub>+</sub> and V <sub>-</sub> . A high level on V <sub>+SENSE</sub> indicates that power is not connected on the bus on V <sub>+</sub> and V <sub>-</sub> .
5	RxD	Receiver Output Data.
6	TxD	Driver Input Data.
7	V <sub>DD1</sub>	Power Supply (Logic Side). Decoupling capacitor to GND <sub>1</sub> required; capacitor value should be between 0.01 $\mu$ F and 0.1 $\mu$ F.
8	GND <sub>1</sub>	Ground (Logic Side).
9	V <sub>-</sub>	Ground (Bus Side).
10	V <sub>REF</sub>	Reference Voltage Output.
11	CANL	Low Level CAN Voltage Input/Output.
12	CANH	High Level CAN Voltage Input/Output.
13	C <sub>INT</sub>	A capacitor of 1 $\mu$ F, 10 V is required on this pin.
14	V <sub>+R</sub>	Connect a 300 $\Omega$ , 750 mW resistor between V <sub>+R</sub> and V <sub>+</sub> . It is recommended that a 10 $\mu$ F capacitor be fitted between V <sub>+R</sub> and GND <sub>2</sub> .
15	V <sub>+</sub>	Bus Power Connection. Connect a 300 $\Omega$ , 750 mW resistor between V <sub>+R</sub> and V <sub>+</sub> .
16	V <sub>-</sub>	Ground (Bus Side).

## CIRCUIT DESCRIPTION

### CAN TRANSCEIVER OPERATION

A CAN bus has two states: dominant and recessive. A dominant state is present on the bus when the differential voltage between CANH and CANL is greater than 0.9 V. A recessive state is present on the bus when the differential voltage between CANH and CANL is less than 0.5 V. During a dominant bus state, the CANH pin is high and the CANL pin is low. During a recessive bus state, both the CANH and CANL pins are in the high impedance state.

### ELECTRICAL ISOLATION

In the ADM3052, electrical isolation is implemented on the logic side of the interface. Therefore, the part has two main sections: a digital isolation section and a transceiver section (see Figure 30). The driver input signal, which is applied to the TxD pin and referenced to the logic ground (GND<sub>1</sub>), is coupled across an isolation barrier to appear at the transceiver section referenced to the isolated ground (V<sub>-</sub>). Similarly, the receiver input and V<sub>+</sub>, which are referenced to the isolated ground in the transceiver section, are coupled across the isolation barrier to appear at the RxD pin and V<sub>+SENSE</sub> referenced to the logic ground, respectively.

### iCoupler Technology

The digital signals transmit across the isolation barrier using iCoupler technology. This technique uses chip scale transformer windings to couple the digital signals magnetically from one side of the barrier to the other. Digital inputs are encoded into waveforms that are capable of exciting the primary transformer

winding. At the secondary winding, the induced waveforms are decoded into the binary value that was originally transmitted.

Positive and negative logic transitions at the input cause narrow (~1 ns) pulses to be sent to the decoder via the transformer. The decoder is bistable and is, therefore, set or reset by the pulses, indicating input logic transitions. In the absence of logic transitions at the input for more than ~1 μs, a periodic set of refresh pulses, indicative of the correct input state, is sent to ensure dc correctness at the output. If the decoder receives no internal pulses for more than about 5 μs, the input side is assumed to be unpowered or nonfunctional, in which case the output is forced to a default state (see Table 9 and Table 10).

### TRUTH TABLES

The truth tables in this section use the abbreviations shown in Table 8.

**Table 8. Truth Table Abbreviations**

Letter	Description
H	High level
L	Low level
I	Indeterminate
X	Don't care
Z	High impedance (off)
NC	Disconnected

**Table 9. Transmitting**

Supply Status		Input	Outputs			
V <sub>DD1</sub>	V <sub>+</sub>	TxD	Bus State	CANH	CANL	V <sub>+SENSE</sub>
On	On	L	Dominant	H	L	L
On	On	H	Recessive	Z	Z	L
On	On	Floating	Recessive	Z	Z	L
Off	On	X	Recessive	Z	Z	I
On	Off	L	I	I	I	H

**Table 10. Receiving**

Supply Status		Inputs		Outputs	
V <sub>DD1</sub>	V <sub>+</sub>	V <sub>ID</sub> = CANH – CANL	Bus State	RxD	V <sub>+SENSE</sub>
On	On	≥ 0.9 V	Dominant	L	L
On	On	≤ 0.5 V	Recessive	H	L
On	On	0.5 V < V <sub>ID</sub> < 0.9 V	I	I	L
On	On	Inputs open	Recessive	H	L
Off	On	X	X	I	I
On	Off	X	X	H	H

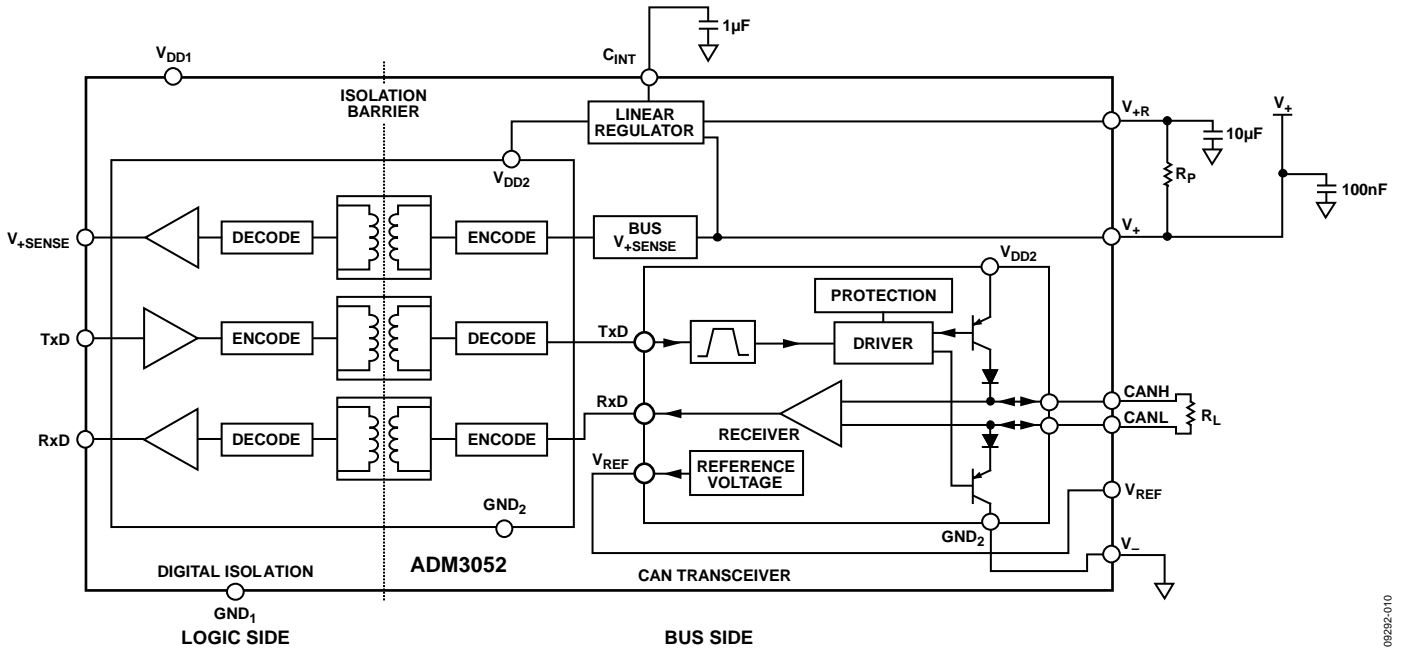

Figure 30. Digital Isolation and Transceiver Sections

09292-010

**THERMAL SHUTDOWN**

The ADM3052 contains thermal shutdown circuitry that protects the part from excessive power dissipation during fault conditions. Shorting the driver outputs to a low impedance source can result in high driver currents. The thermal sensing circuitry detects the increase in die temperature under this condition and disables the driver outputs. This circuitry is designed to disable the driver outputs when a junction temperature of 150°C is reached. As the device cools, the drivers reenable at a temperature of 140°C.

**LINEAR REGULATOR**

The linear regulator takes the V+ bus power (ranging between 11 V to 25 V) and regulates this voltage to 5 V to provide power to the internal bus-side circuitry (iCoupler isolation, V+SENSE, and transceiver circuits). The linear regulator uses two regulation loops to share the power dissipation between the internal die and an external resistor. This reduces the internal heat dissipation in the package. The 300 Ω external resistor should be capable of dissipating 750 mW of power and have a tolerance of 1%.

**MAGNETIC FIELD IMMUNITY**

The limitation on the magnetic field immunity of the iCoupler is set by the condition in which an induced voltage in the receiving coil of the transformer is large enough to either falsely set or reset the decoder. The following analysis defines the conditions under which this may occur. The 3 V operating condition of the ADM3052 is examined because it represents the most susceptible mode of operation.

The pulses at the transformer output have an amplitude greater than 1 V. The decoder has a sensing threshold of about 0.5 V, thus establishing a 0.5 V margin in which induced voltages can be tolerated.

The voltage induced across the receiving coil is given by

$$V = \left( \frac{-d\beta}{dt} \right) \sum \pi r_n^2 ; n = 1, 2, \dots, N$$

where:

$\beta$  is the magnetic flux density (gauss).

$N$  is the number of turns in the receiving coil.

$r_n$  is the radius of the  $n^{\text{th}}$  turn in the receiving coil (cm).

Given the geometry of the receiving coil and an imposed requirement that the induced voltage is, at most, 50% of the 0.5 V margin at the decoder, a maximum allowable magnetic field can be determined using Figure 31.

Figure 31. Maximum Allowable External Magnetic Flux Density

For example, at a magnetic field frequency of 1 MHz, the maximum allowable magnetic field of 0.2 kgauss induces a voltage of 0.25 V at the receiving coil. This is about 50% of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event occurs during a transmitted pulse and is the worst-case polarity, it reduces the received pulse from >1.0 V to 0.75 V, still well above the 0.5 V sensing threshold of the decoder.

Figure 32 shows the magnetic flux density values in terms of more familiar quantities, such as maximum allowable current flow at given distances away from the ADM3052 transformers.

Figure 32. Maximum Allowable Current for Various Current-to-ADM3052 Spacings

With combinations of strong magnetic field and high frequency, any loops formed by PCB traces can induce error voltages large enough to trigger the thresholds of succeeding circuitry. Care should be taken in the layout of such traces to avoid this possibility.

## APPLICATIONS INFORMATION

### TYPICAL APPLICATIONS

Figure 33. Typical Isolated CAN Node Using the ADM3052

### DEVICENET™ AND THE ADM3052 CAN TRANSCEIVER

DeviceNet is a digital multidrop network that connects actuators, sensors, and a broad range of industrial automation systems. DeviceNet is managed by the Open DeviceNet Vendor Association (ODVA) and is accepted by international standards bodies around the world, with a large number of companies offering DeviceNet products.

The Communications and Information Protocol (CIP™) is a communications protocol for transferring automation data between two devices. DeviceNet is a combination of CIP™ (for upper layers of the network) and the CAN physical layer for the data link layer. DeviceNet allows up to 64 nodes on a single network, with node addresses ranging from 0 to 63. DeviceNet supports 125 kbps, 250 kbps, and 500 kbps data rates and supports master and slave as well as peer-to-peer communication. The ADM3052 can be used as the CAN physical layer transceiver for a DeviceNet implementation. Refer to the AN-1123 Application Note for a CAN implementation guide.

DeviceNet supports both isolated and nonisolated physical layer design of devices. An isolated design option allows externally powered devices (for example, ac drive starters and solenoid valves) to share the same bus cable. DeviceNet requires the support of the standard industrial voltage range from 11 V dc to 25 V dc. The ADM3052 employs Analog Devices iCoupler technology, combines a 3-channel isolator, a CAN transceiver, and a linear regulator into a single package. Isolated power is supplied to the bus side of the ADM3052 by an isolated 24 V supply across the bus.

The internal regulator provides the 5 V supply required internally by the CAN transceiver. The logic side of the ADM3052 requires a single 3.3 V or 5 V supply.
