

OPA1013

Precision, Single-Supply DUAL OPERATIONAL AMPLIFIER

FEATURES

- SINGLE POWER SUPPLY OPERATION
- INPUT VOLTAGE RANGE TO GROUND
- OUTPUT SWINGS NEAR GROUND
- LOW QUIESCENT CURRENT: 550 μ A max
- LOW V_{os} : 300 μ V max
- LOW DRIFT: 2.5 μ V/ $^{\circ}$ C max
- LOW I_{os} : 1.5nA max
- LOW NOISE: 0.55 μ Vp-p, 0.1Hz to 10Hz

APPLICATIONS

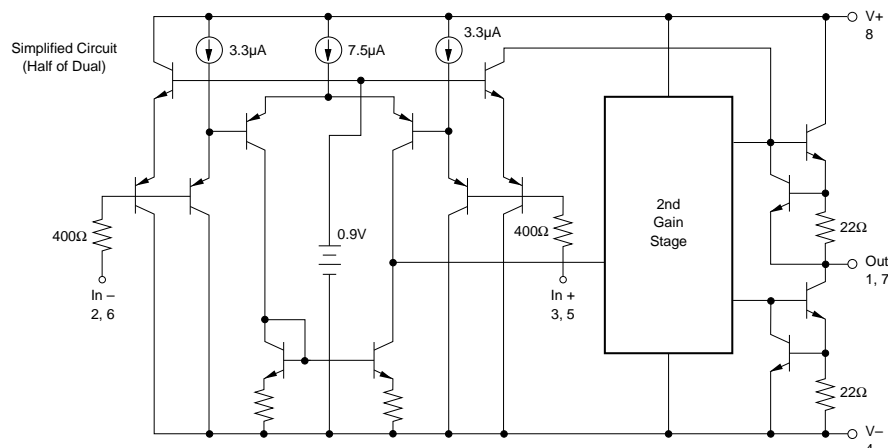

- PRECISION INSTRUMENTATION
- BATTERY-POWERED EQUIPMENT
- BRIDGE AMPLIFIERS
- 4-20mA CURRENT TRANSMITTERS
- VOLTAGE COMPARATOR

DESCRIPTION

The OPA1013 dual operational amplifier provides precision performance in single power supply and low power applications. It is laser trimmed for low offset voltage and drift, greatly reducing the large errors common with LM324-type op amps. Input offset current is also trimmed to reduce errors in high impedance applications.

The OPA1013 is characterized for operation at both +5V (single supply) and ± 15 V power supplies. When operated from a single supply, the input common-mode range includes ground and the output can swing to within 15mV of ground. Completely independent biasing networks eliminate interaction between the two amplifiers—even when one is used as a comparator.

The OPA1013 is available in an 8-pin plastic DIP specified for the 0 $^{\circ}$ C to +70 $^{\circ}$ C temperature range.

APPLICATIONS INFORMATION

The OPA1013 is unity-gain stable, making it easy to use and free from oscillations in the widest range of circuitry. Follow good design practice by bypassing the power supplies close to the op amp pins. In most cases 0.1 μ F ceramic capacitors are adequate.

SINGLE POWER SUPPLY OPERATION

The OPA1013 is specified for operation from a single power supply. This means that linear operation continues with the input terminals at (or even somewhat below) ground potential. When used in a non-inverting amplifier, 0V input must produce 0V output. In practice, the output swing is limited to approximately 15mV above ground with no load. Output swing near ground can be optimized when the output load is connected to ground. If the output must sink current, the ability to swing near ground will be diminished. The output swings to within approximately 200mV of ground when sinking 1mA.

INPUT PROTECTION

The circuitry of the OPA1013 is protected against overload for input voltages ranging from the positive supply voltage to 5V below the negative supply voltage (below ground in single supply operation). No external protection circuitry is required, as it is with other common single-supply op amps.

Furthermore, the OPA1013 is free from phase-reversal problems common with other single-supply op amps. When the inputs are driven below ground (or below the negative power supply), the output polarity remains correct.

COMPARATOR OPERATION

The OPA1013 functions well as a comparator, where high speed is not required. Sometimes, in fact, the low offset and docile characteristics of the OPA1013 may simplify the design of comparator circuitry. The two op amps in the OPA1013 use completely independent bias circuitry to avoid interaction when the inputs are over-driven. Driving one op amp into saturation will not affect the characteristics of the other amplifier. The outputs of the OPA1013 can drive one TTL load. Quiescent current remains stable when the inputs are overdriven.

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgment, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

Customers are responsible for their applications using TI components.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
