

18/36/72-Mbit Programmable FIFOs

Features

- Memory organization
 - Industry's largest first in first out (FIFO) memory densities: 18-Mbit, 36-Mbit, and 72-Mbit
 - Selectable memory organization: x 9, x 12, x 16, x 18, x 20, x 24, x 32, x 36
- Up to 133-MHz clock operation
- Unidirectional operation
- Independent read and write ports
 - Supports simultaneous read and write operations
 - Reads and writes operate on independent clocks, upto a maximum ratio of two, enabling data buffering across clock domains.
 - Supports multiple I/O voltage standard: low voltage complementary metal oxide semiconductor (LVCMOS) 3.3 V and 1.8 V voltage standards.
- Input and output enable control for write mask and read skip operations
- Mark and retransmit: resets read pointer to user marked position
- Empty, full, half-full, and programmable almost-empty and almost-full status flags with configured offsets
- Flow-through mailbox register to send data from input to output port, bypassing the FIFO sequence
- Configure programmable flags and registers through serial or parallel modes
- Separate serial clock (SCLK) input for serial programming
- Master reset to clear entire FIFO
- Partial reset to clear data but retain programmable settings
- Joint test action group (JTAG) port provided for boundary scan function
- Industrial temperature range: -40 °C to +85 °C

Functional Description

The Cypress programmable FIFO family offers the industry's highest-density programmable FIFO memory device. It has independent read and write ports, which can be clocked up to 133 MHz. User can configure input and output bus sizes. The maximum bus size of 36 bits enables a maximum data throughput of 4.8 Gbps. The user-programmable registers enable user to configure the device operation as desired. The device also offers a simple and easy-to-use interface to reduce implementation and debugging efforts, improve time-to-market, and reduce engineering costs. This makes it an ideal memory choice for a wide range of applications including multiprocessor interfaces, video and image processing, networking and telecommunications, high-speed data acquisition, or any system that needs buffering at high speeds across different clock domains.

As implied by the name, the functionality of the FIFO is such that the data is read out of the read port in the same sequence in which it was written into the write port. If writes and inputs are enabled (WEN & IE), data on the write port gets written into the device at the rising edge of write clock. Enabling reads and outputs (REN & OE) fetches data on the read port at every rising edge of read clock. Both reads and writes can occur simultaneously at different speeds provided the ratio between read and write clock is in the range of 0.5 to 2. Appropriate flags are set whenever the FIFO is empty, almost-empty, half-full, almost-full or full.

The device also supports mark and retransmit of data, and a flow-through mailbox register.

All product features and specs are common to all densities (CYF0072V, CYF0036V, and CYF0018V). All descriptions are given assuming the 72Mbit (CYF0072V) device is operated in x 36 mode. They are valid for other densities (CYF0036V, and CYF0018V) and all port sizes x 9, x 12, x 16, x 18, x 20, x 24 and x 32 unless otherwise specified. The only difference will be in the input and output bus width. [Table 1 on page 7](#) shows the part of bus with valid data from D[35:0] and Q[35:0] in x 9, x 12, x 16, x 18, x 20, x 24, x 32 and x 36 modes.

Errata: For information on silicon errata, see [Errata](#) on page 31. Details include trigger conditions, devices affected and proposed workaround.

Notes

1. Pin Diagram for 18-Mbit, 36-Mbit & 72-Mbit; 1.8V & 3.3V IO voltage options.
2. This pin should be tied to V_{SS} preferably or can be left floating to ensure normal operation.

Pin Definitions

| Pin Name | I/O | Pin Description |
|-----------------------------|--------|--|
| $\overline{\text{MRS}}$ | Input | Master reset: $\overline{\text{MRS}}$ initializes the internal read and write pointers to zero, resets all flags and sets the output register to all zeroes. During Master Reset, the configuration registers are set to default values. |
| $\overline{\text{PRS}}$ | Input | Partial reset: $\overline{\text{PRS}}$ initializes the internal read and write pointers to zero, resets all flags and sets the output register to all zeroes. During Partial Reset, the configuration register settings are retained. |
| PORTSZ [2:0] | Input | Port word size select: Port word width select pins (common for read and write ports). |
| WCLK | Input | Write clock: The rising edge clocks data into the FIFO when writes are enabled ($\overline{\text{WEN}}$ asserted). Data is written into the FIFO memory when $\overline{\text{LD}}$ is high and into configuration registers when $\overline{\text{LD}}$ is low. |
| $\overline{\text{LD}}$ | Input | Load: When $\overline{\text{LD}}$ is LOW, D[7:0] (Q[7:0]) are written (read) into (from) the configuration registers. When $\overline{\text{LD}}$ is HIGH, D[35:0] (Q[35:0]) are written (read) into (from) the FIFO memory. |
| $\overline{\text{WEN}}$ | Input | Write enable: Control signal to enable writes to the device. When $\overline{\text{WEN}}$ is low data present on the inputs is written to the FIFO memory or configuration registers on every rising edge of WCLK. |
| $\overline{\text{IE}}$ | Input | Input enable: $\overline{\text{IE}}$ is the data input enable signal that controls the enabling and disabling of the 36-bit data input pins. If it is enabled, data on the D[35:0] pins is written into the FIFO. The internal write address pointer is always incremented at rising edge of WCLK if $\overline{\text{WEN}}$ is enabled, regardless of the $\overline{\text{IE}}$ level. This is used for 'write masking' or incrementing the write pointer without writing into a location. |
| D[35:0] | Input | Data inputs: Data inputs for a 36-bit bus. |
| RCLK | Input | Read clock: The rising edge initiates a read from the FIFO when reads are enabled ($\overline{\text{REN}}$ asserted). Data is read from the FIFO memory when $\overline{\text{LD}}$ is high & from the configuration registers if $\overline{\text{LD}}$ is low. |
| $\overline{\text{REN}}$ | Input | Read enable: Control signal to enable reads from the device. When $\overline{\text{REN}}$ is low data is read from the FIFO memory or configuration registers on every rising edge of RCLK. |
| $\overline{\text{OE}}$ | Input | Output enable: When $\overline{\text{OE}}$ is LOW, FIFO data outputs are enabled; when $\overline{\text{OE}}$ is HIGH, the FIFO's outputs are in High Z (high impedance) state. |
| Q[35:0] | Output | Data outputs: Data outputs for a 36-bit bus. |
| $\overline{\text{DVal}}$ | Output | Data valid: Active low data valid signal to indicate valid data on Q[35:0]. |
| MARK | Input | Mark for retransmit: When this pin is asserted the memory location corresponding to the data present on the output bus is marked. Any subsequent retransmit operation resets the read pointer to this location. |
| RT | Input | Retransmit: A HIGH pulse on RT resets the internal read pointer to a physical location of the FIFO which is marked by the user (using MARK pin). With every valid read cycle after retransmit, previously accessed data is read until the FIFO is empty. |
| MB | Input | Mailbox: When asserted the reads and writes happen to flow-through mailbox register. |
| $\overline{\text{EF}}$ | Output | Empty flag: When $\overline{\text{EF}}$ is LOW, the FIFO is empty. $\overline{\text{EF}}$ is synchronized to RCLK. |
| $\overline{\text{PAE}}$ | Output | Programmable almost-empty: When $\overline{\text{PAE}}$ is LOW, the FIFO is almost empty based on the almost-empty offset value programmed into the FIFO. It is synchronized to RCLK. |
| $\overline{\text{HF}}$ | Output | Half-full flag: When $\overline{\text{HF}}$ is LOW, half of the FIFO is full. $\overline{\text{HF}}$ is synchronized to WCLK. |
| $\overline{\text{PAF}}$ | Output | Programmable almost-full: When $\overline{\text{PAF}}$ is LOW, the FIFO is almost full based on the almost-full offset value programmed into the FIFO. It is synchronized to WCLK. |
| $\overline{\text{FF}}$ | Output | Full flag: When $\overline{\text{FF}}$ is LOW, the FIFO is full. $\overline{\text{FF}}$ is synchronized to WCLK. |
| SPI_SCLK | Input | Serial clock: A rising edge on SPI_SCLK clocks the serial data present on the SPI_SI input into the offset registers if SPI_SEN is enabled. |
| SPI_SI | Input | Serial input: Serial input data in SPI mode. |
| $\overline{\text{SPI_SEN}}$ | Input | Serial enable: Enables serial loading of programmable flag offsets and configuration registers. |
| TCK | Input | Test clock (TCK) pin for JTAG. |

Pin Definitions (continued)

| Pin Name | I/O | Pin Description |
|--------------------------|--------------------|--|
| $\overline{\text{TRST}}$ | Input | Reset pin for JTAG. |
| TMS | Input | Test mode select (TMS) pin for JTAG. |
| TDI | Input | Test data in (TDI) pin for JTAG. |
| TDO | Output | Test data out (TDO) pin for JTAG. |
| V _{REF} | Input Reference | Reference voltage: Reference voltage (regardless of I/O standard used) |
| V _{CC1} | Power Supply | Core voltage supply 1: 1.8 V supply voltage |
| V _{CC2} | Power Supply | Core voltage supply 2: 1.5 V supply voltage |
| V _{CCIO} | Power Supply | Supply for I/Os |
| V _{SS} | Ground | Ground |
| DNU | – | Do not use: These pins need to be left floating. |

Architecture

The CYF0072V, CYF0036V, and CYF0018V are memory arrays of 72-Mbit, 36-Mbit, and 18-Mbit respectively. The memory organization is user configurable and word sizes can be selected as $\times 9$, $\times 12$, $\times 16$, $\times 18$, $\times 20$, $\times 24$, $\times 32$, or $\times 36$. The logic blocks to implement the FIFO functionality and the associated features are built around these memory arrays.

The input and output data buses have a maximum width of 36 bits. The input data bus goes to an input register and the data flow from the input register to the memory is controlled by the write control logic. The inputs to the write logic block are \overline{WCLK} , \overline{WEN} and \overline{IE} . When the writes are enabled through \overline{WEN} and if the inputs are enabled by \overline{IE} , then the data on the input bus is written into the memory array at the rising edge of \overline{WCLK} . This also increments the write pointer. Enabling writes but disabling the data input pins through \overline{IE} only increments the write pointer without doing any writes or altering the contents of the memory location.

Similarly, the output register is connected to the data output bus. Transfer of contents from the memory to the output register is controlled by the read control logic. The inputs to the read control logic include \overline{RCLK} , \overline{REN} , \overline{OE} , \overline{RT} and \overline{MARK} . When reads are enabled by \overline{REN} and outputs are enabled using \overline{OE} , the data from the memory pointed by the read pointer is transferred to the output data bus at the rising edge of \overline{RCLK} along with active low \overline{DVal} . If the outputs are disabled but the reads enabled, the outputs are in high impedance state, but internally the read pointer is incremented.

During write operation, the number of writes performed is always an even number (i.e., minimum write burst length is two and number of writes always a multiple of two). Whereas during read operation, the number of reads performed can be even or odd (i.e., minimum read burst length is one).

The \overline{MARK} signal is used to 'mark' the location from which data is retransmitted when requested and \overline{RT} is asserted to retransmit the data from the marked location.

Reset Logic

The FIFO can be reset in two ways: Master Reset (\overline{MRS}) and Partial Reset (\overline{PRS}). The \overline{MRS} initializes the read and write pointers to zero and sets the output register to all zeroes. It also resets all flags & the configuration registers to their default values. The word size is configured through pins; values of the three \overline{PORTSZ} pins are latched during \overline{MRS} . A Master Reset is required after power-up before accessing the FIFO.

\overline{PRS} resets the read pointer, write pointer and mark location to the first physical location in the memory array. It also resets all flags to their default values. \overline{PRS} does not affect the programmed configuration register values. Any changes to configuration registers during device operation mandates a \overline{PRS} cycle to guarantee accurate flag operation.

Selecting Word Sizes

The word sizes are configured based on the logic levels on the \overline{PORTSZ} pins during the master reset (\overline{MRS}) cycle only (latched on low to high edge). The port size cannot be changed during normal mode of operation and these pins are ignored. Table 1. explains the pins of $D[35:0]$ and $Q[35:0]$ that will have valid data in modes where the word size is less than $\times 36$. If word size is less than $\times 36$, the unused output pins are tri-stated by the device and unused input pins will be ignored by the internal logic. The pins with valid data input $D[N:0]$ and output $Q[N:0]$ is given in Table 1.

Memory Organization for Different Port Sizes

The 72-Mbit memory has different organization for different port sizes. Table 1 shows the depth of the FIFO for all port sizes.

Note that for all port sizes, four to eight locations are not available for writing the data and are used to safeguard against false synchronization of empty and full flags.

Table 1. Word Size Selection

| $\overline{PORTSZ}[2:0]$ | Word Size | FIFO Depth ^[3] | Memory Size ^[3] | Active Input Data Pins $D[N:0]$ | Active Output Data Pins $Q[N:0]$ |
|--------------------------|-------------|---------------------------|----------------------------|---------------------------------|----------------------------------|
| 000 | $\times 9$ | 8 Meg | 72-Mbit | $D[8:0]$ | $Q[8:0]$ |
| 001 | $\times 12$ | 4 Meg | 48-Mbit | $D[11:0]$ | $Q[11:0]$ |
| 010 | $\times 16$ | 4 Meg | 64-Mbit | $D[15:0]$ | $Q[15:0]$ |
| 011 | $\times 18$ | 4 Meg | 72-Mbit | $D[17:0]$ | $Q[17:0]$ |
| 100 | $\times 20$ | 2 Meg | 40-Mbit | $D[19:0]$ | $Q[19:0]$ |
| 101 | $\times 24$ | 2 Meg | 48-Mbit | $D[23:0]$ | $Q[23:0]$ |
| 110 | $\times 32$ | 2 Meg | 64-Mbit | $D[31:0]$ | $Q[31:0]$ |
| 111 | $\times 36$ | 2 Meg | 72-Mbit | $D[35:0]$ | $Q[35:0]$ |

Note

3. For all port sizes, four to eight locations are not available for writing the data.

Data Valid Signal ($\overline{\text{DVal}}$)

Data valid ($\overline{\text{DVal}}$) is an active low signal, synchronized to RCLK and is provided to check for valid data on the output bus. When a read operation is performed, the $\overline{\text{DVal}}$ signal goes low along with output data. This helps user to capture the data without keeping track of REN to data output latency. This signal also helps when write and read operations are performed continuously at different frequencies by indicating when valid data is available at the output port Q[35:0].

Write Mask and Read Skip Operation

As mentioned in [Architecture on page 7](#), enabling writes but disabling the inputs (IE HIGH) increments the write pointer without doing any write operations or altering the contents of the location.

This feature is called Write Mask and allows user to move the write pointer without actually writing to the locations. This “write masking” ability is useful in some video applications such as Picture In Picture (PIP).

Similarly, during a read operation, if the outputs are disabled by keeping the OE high, the read data does not appear on the output bus; however, the read pointer is incremented. This feature is referred to as a Read Skip Operation.

Flow-through Mailbox Register

This feature transfers data from input to output directly bypassing the FIFO sequence. When MB signal is asserted the data present in D[35:0] will be available at Q[35:0] after two WCLK cycles. Normal read and write operations are not allowed during flow-through mailbox operation. Before starting Flow-through mailbox operation FIFO read should be completed to make data valid $\overline{\text{DVal}}$ high in order to avoid data loss from FIFO. The width of flow-through mailbox register always corresponds to port size.

Flag Operation

This device provides five flag pins to indicate the condition of the FIFO.

Full Flag

The Full Flag ($\overline{\text{FF}}$) operates on double word (burst length of two) boundaries and goes LOW when the device is full. Write operations are inhibited whenever $\overline{\text{FF}}$ is LOW regardless of the state of WEN. $\overline{\text{FF}}$ is synchronized to WCLK, that is, it is exclusively updated by each rising edge of WCLK. The worst

case assertion latency for Full Flag is four. As the user cannot know that the FIFO is full for four clock cycles, it is possible that user continues writing data during this time. In this case, the four data words written will be stored to prevent data loss and these words have to be read back in order for full flag to get de-asserted. The minimum number of reads required to de-assert full-flag is two and the maximum number of reads required to de-assert full flag is six. The assertion and de-assertion of Full flag with associated latencies is explained in Latency Table on page 14.

Half-Full Flag

The Half-Full ($\overline{\text{HF}}$) flag goes LOW when half of the memory array is written. HF is synchronized to WCLK. The assertion and de-assertion of Half-Full flag with associated latencies is explained in [Latency Table on page 16](#).

Empty Flag

The Empty Flag ($\overline{\text{EF}}$) deassertion depends on burst writes and goes LOW when the device is empty. Read operations are inhibited whenever $\overline{\text{EF}}$ is LOW, regardless of the state of REN. $\overline{\text{EF}}$ is synchronized to RCLK, that is, it is exclusively updated by each rising edge of RCLK. The assertion and de-assertion of Empty flag with associated latencies is explained in [Latency Table on page 16](#).

Programmable Almost-Empty and Almost-Full Flags

The CYF0072V includes programmable Almost-Empty and Almost-Full flags. Each flag operates on word boundaries and is programmed (see [Programming Flag Offsets and Configuration Registers on page 9](#)) a specific distance from the corresponding boundary flags (Empty or Full). (offset can range from 16 to 1023) When the FIFO contains the number of words for which the flags are programmed, the PAF or PAE is asserted, signifying that the FIFO is either almost-full or almost-empty. The default flag offset for both PAE and PAF is 127 words. These programmable flag boundaries have thresholds associated with them. [Table 2](#) gives the assertion and de-assertion conditions for PAE & PAF flags based on these thresholds assuming default offset values.

The PAF flag signal transition is caused by the rising edge of WCLK and the PAE flag transition is caused by the rising edge of RCLK. The assertion and de-assertion of these flags with associated latencies is explained in [Latency Table on page 16](#).

Table 2. Programmable Flag Assertion/De-assertion Thresholds

| Operation | PAE offset | Number of FIFO words - PAE | PAF offset | Number of FIFO words - PAF |
|-------------|------------|--|------------|--|
| Assertion | 127 | # FIFO words \leq (PAE offset + 2) i.e. # FIFO words \leq 129 | 127 | # FIFO words \geq FIFO depth - (offset + 1) i.e. # FIFO words \geq 2M - 128 |
| Deassertion | 127 | # FIFO words $>$ (offset) i.e. # FIFO words $>$ 127 | 127 | # FIFO words $<$ FIFO depth - (offset) i.e. # FIFO words $<$ 2M - 127 |

Retransmit from Mark Operation

The retransmit feature is useful for transferring packets of data repeatedly. It enables the receipt of data to be acknowledged by the receiver and retransmitted if necessary. Initiation of a retransmit operation (using RT pin) resets the internal read pointer to a physical location of the FIFO that is marked by the user (using the MARK pin). With every valid read cycle after retransmit, data is read out starting from the marked location and the read pointer is incremented until the FIFO is empty. Data written to FIFO after initiation of a retransmit operation are also transmitted. The full depth of the FIFO can be repeatedly retransmitted.

Flags are governed by the relative locations of the read and write pointers and are updated during a retransmit cycle. Refer to the latency table for the associated flag update latencies after initiation of a retransmit cycle^[4].

Asserting RT initiates a retransmit operation. The retransmit feature can be used when two or more data words have been written to the FIFO. When the MARK pin is asserted, the memory location corresponding to the data present on the output bus is marked. A mark operation is mandated prior to initiating a Retransmit operation.

A retransmit operation should not be initiated when reads or writes are in progress. User should wait for four RCLK cycles after disabling reads before RT is asserted to ensure that the reads are completed.

On initiation of RT the 'marked' location becomes the new Full Boundary. If user continues to write the data after initiation of a retransmit operation, \overline{FF} will be asserted when this boundary is reached i.e. \overline{FF} is asserted once the write pointer reaches the marked location. This prevents overwriting and data-loss. During RT reads the full boundary remains frozen to the marked location and is released when the FIFO becomes empty. i.e. \overline{FF} remains LOW until the entire FIFO is read. Full flag is released

$L_{FF_RELEASE}$ clocks after the \overline{FF} is asserted. Full boundary is also released on a reset operation (MRS or PRS)^[4].

Refer to [Latency Table on page 16](#) for more details.

Programming Flag Offsets and Configuration Registers

The CYF0072V has ten 8-bit user configurable registers. These registers contain the almost-full (M) and almost-empty (N) offset values which decide when the PAF and PAE flags are asserted.

These registers can be programmed in one of two ways: serial loading or parallel loading method. The loading method is selected using the SPI_SEN (Serial Enable) pin. A low on the SPI_SEN selects the serial method for writing into the registers. For serial programming, there is a separate SCLK and a Serial Input (SI). In parallel mode, a LOW on the load (LD) pin causes the write and read operation to these registers. The write and read operation happens from the first location (0x1) to the last location (0xA) in a sequence. If LD is HIGH, the writes occur to the FIFO.

Register values can be read through the parallel output port regardless of the programming mode selected (serial or parallel). Register values cannot be read serially. The registers may be programmed (and reprogrammed) any time after master reset, regardless of whether serial or parallel programming is selected. Any changes to configuration registers during device operation mandates a PRS cycle to guarantee accurate flag operation.

See [Table 4 on page 11](#) and [Table 5 on page 12](#) for access to configuration registers in serial and parallel modes.

In parallel mode, the read and write operations loop back when the maximum address location of the configuration registers is reached. Simultaneous read and write operations should be avoided on the configuration registers. Any change in configuration registers will take effect after eight write clock cycles (WCLK) cycles.

Note

4. **Errata:** Refer to [Errata](#) on page 31 for details on flag operation and full boundary freezing during Mark and Retransmit operation.

Table 3. Configuration Registers

| ADDR | Configuration Register | Default | Bit [7] | Bit [6] | Bit [5] | Bit [4] | Bit [3] | Bit [2] | Bit [1] | Bit [0] |
|------|--|------------|--------------|---------|---------|---------|---------|---------|---------|---------|
| 0x1 | Reserved | 0x00 | X | X | X | X | X | X | X | X |
| 0x2 | Reserved | 0x00 | X | X | X | X | X | X | X | X |

Table 4. Writing and Reading Configuration Registers in Parallel Mode

| SPI_SEN | LD | WEN | REN | WCLK | RCLK | SPI_SCLK | Operation |
|---------|----|-----|-----|---|---|----------|---|
| 1 | 0 | 0 | 1 | ↑ First rising edge because both LD and WEN are low | X | X | Parallel write to first register |
| 1 | 0 | 0 | 1 | ↑ Second rising edge | X | X | Parallel write to second register |
| 1 | 0 | 0 | 1 | ↑ Third rising edge | X | X | Parallel write to third register |
| 1 | 0 | 0 | 1 | ↑ Fourth rising edge | X | X | Parallel write to fourth register |
| 1 | 0 | 0 | 1 | • | X | X | • |
| 1 | 0 | 0 | 1 | • | X | X | • |
| 1 | 0 | 0 | 1 | • | X | X | • |
| 1 | 0 | 0 | 1 | ↑ Tenth rising edge | X | X | Parallel write to tenth register |
| 1 | 0 | 0 | 1 | ↑ Eleventh rising edge | X | X | Parallel write to first register (roll back) |
| 1 | 0 | 1 | 0 | X | ↑ First rising edge since both LD and REN are low | X | Parallel read from first register |
| 1 | 0 | 1 | 0 | X | ↑ Second rising edge | X | Parallel read from second register |
| 1 | 0 | 1 | 0 | X | ↑ Third rising edge | X | Parallel read from third register |
| 1 | 0 | 1 | 0 | X | ↑ Fourth rising edge | X | Parallel read from fourth register |
| 1 | 0 | 1 | 0 | X | • | X | • |
| 1 | 0 | 1 | 0 | X | • | X | • |
| 1 | 0 | 1 | 0 | X | • | X | • |
| 1 | 0 | 1 | 0 | X | ↑ Tenth rising edge | X | Parallel read from tenth register |
| 1 | 0 | 1 | 0 | X | ↑ Eleventh rising edge | X | Parallel read from first register (roll back) |
| 1 | X | 1 | 1 | X | X | X | No operation |
| X | 1 | 0 | X | ↑ Rising edge | X | X | Write to FIFO memory |
| X | 1 | X | 0 | X | ↑ Rising edge | X | Read from FIFO memory |
| 0 | 0 | X | 1 | X | X | X | Illegal operation |

Table 5. Writing into Configuration Registers in Serial Mode

| SPI_SEN | LD | WEN | REN | WCLK | RCLK | SCLK | Operation |
|---------|----|-----|-----|---------------|---------------|---------------|---|
| 0 | 1 | X | X | X | X | ↑ Rising edge | Each rising of the SCLK clocks in one bit from the SI (Serial In). Any of the 10 registers can be addressed and written to, following the SPI protocol. |
| X | 1 | 0 | X | ↑ Rising edge | X | X | Parallel write to FIFO memory. |
| X | 1 | X | 0 | X | ↑ Rising edge | X | Parallel read from FIFO memory. |
| 1 | 0 | 1 | 1 | X | X | X | This corresponds to parallel mode (refer to Table 4 on page 11). |

Figure 2. Serial WRITE to Configuration Register

Width Expansion Configuration

The width of CYFX072V can be expanded to provide word widths greater than 36 bits. During width expansion mode, all control line inputs are common and all flags are available. Empty (Full) flags are created by ANDing the Empty (Full) flags of every FIFO; the PAE and PAF flags can be detected from any one device. This technique avoids reading data from or writing data to the FIFO that is “staggered” by one clock cycle due to the variations in skew between RCLK and WCLK. Figure 3 demonstrates an example of 72 bit-word width by using two 36-bit word CYFX072Vs.

Figure 3. Using Two CYFX072V for Width Expansion

Power Up

The device becomes functional after V_{CC1} , V_{CC2} , V_{CCIO} , and V_{REF} attain minimum stable voltage required as given in [Recommended DC Operating Conditions on page 15](#). The device can be accessed t_{PU} time after these supplies attain the minimum required level (see [Switching Characteristics on page 18](#)). There is no specific power sequencing required for the device.

Read/Write Clock Requirements

The read and write clocks must satisfy the following requirements:

- Both read (RCLK) and write (WCLK) clocks should be free-running.
- The clock frequency for both clocks should be between the minimum and maximum range given in [Electrical Characteristics on page 15](#).
- The WCLK to RCLK ratio should be in the range of 0.5 to 2.

For proper FIFO operation, the device must determine which of the input clocks – RCLK or WCLK – is faster. This is evaluated using counters after the MRS cycle. The device uses two 9-bit counters (one running on RCLK and other on WCLK), which count 256 cycles of read and write clocks after MRS. The clock of the counter which reaches its terminal count first is used as master clock inside the FIFO.

When there is change in the relative frequency of RCLK and WCLK during normal operation of FIFO, user can specify it by using “Fast CLK bit” in the configuration register (0xA).

“1” - indicates $f_{req}(WCLK) > f_{req}(RCLK)$

“0” - indicates $f_{req}(WCLK) < f_{req}(RCLK)$

The result of counter evaluated frequency is available in this register bit. User can override the counter evaluated frequency for faster clock by changing this bit.

Whenever there is a change in this bit value, user must wait t_{PLL} time before issuing the next read or write to FIFO.

JTAG Operation

CYFX072V has two devices connected internally in a JTAG chain as shown in Figure 4

Figure 4. Device Connection in a JTAG Chain

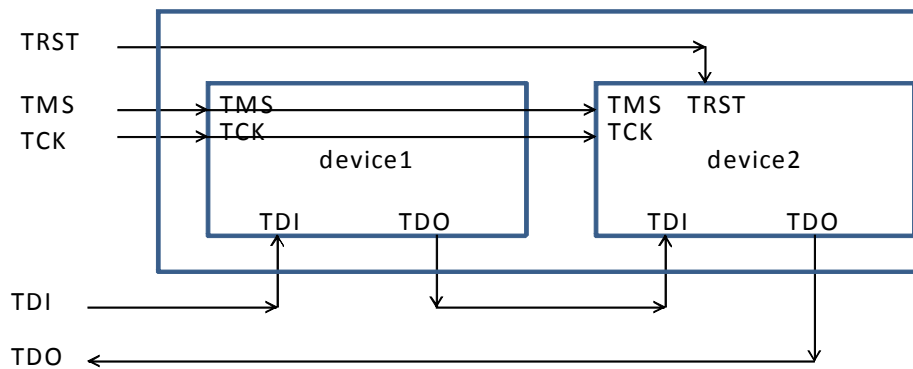

Table 6 shows the IR register length and device ID

Table 6. JTAG IDCODES

| | IR Register Length | Device ID (HEX) | Bypass Register Length |
|----------|--------------------|-----------------|------------------------|
| Device-1 | 3 | "Ignore" | 1 |
| Device-2 | 8 | 1E3261CF | 1 |

Table 7. JTAG Instructions for Device-1

| Device-1 | Opcode (Binary) |
|----------|-----------------|
| BYPASS | 111 |

Table 8. JTAG Instructions for Device-2

| Device-2 | Opcode (HEX) |
|----------------|--------------|
| EXTEST | 00 |
| HIGHZ | 07 |
| SAMPLE/PRELOAD | 01 |
| BYPASS | FF |
| IDCODE | 0F |

Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. These user guidelines are not tested.

Storage temperature (without bias) -65 °C to +150 °C
 Ambient temperature with power applied -55 °C to +125 °C
 Core supply voltage 1 (V_{CC1}) to ground potential -0.3 V to 2.5 V
 Core supply voltage 2 (V_{CC2}) to ground potential -0.3 V to 1.65 V
 Latch up current >100 mA
 I/O port supply voltage (V_{CCIO}) -0.3 V to 3.7 V

Voltage applied to I/O pins -0.3 V to 3.75 V
 Output current into outputs (LOW) 24 mA
 Static discharge voltage (per MIL-STD-883, Method 3015) > 2001 V

Operating Range

| Range | Ambient Temperature |
|------------|---------------------|
| Industrial | -40 °C to +85 °C |

Recommended DC Operating Conditions

| Parameter ^[5] | Description | Min | Typ | Max | Unit | |
|--------------------------|---|-----------|------|-------|------|---|
| V_{CC1} | Core supply voltage 1 | 1.70 | 1.80 | 1.90 | V | |
| V_{CC2} | Core supply voltage 2 | 1.425 | 1.5 | 1.575 | V | |
| V_{REF} | Reference voltage (irrespective of I/O standard used) | 0.7 | 0.75 | 0.8 | V | |
| V_{CCIO} | I/O supply voltage, read and write banks. | LVC MOS33 | 3.00 | 3.30 | 3.60 | V |
| | | LVC MOS18 | 1.70 | 1.8 | 1.90 | V |

Electrical Characteristics

| Parameter | Description | Conditions | Min | Typ | Max | Unit |
|-----------|---|--|-----|-----|-----|---------|
| I_{CC} | Active current | $V_{CC1} = V_{CC1MAX}$ | - | - | 300 | mA |
| | | $V_{CC2} = V_{CC2MAX}$ (All I/O switching, 133 MHz) | - | - | 600 | mA |
| | | $V_{CCIO} = V_{CCIO MAX}$ (All outputs disabled) | - | - | 100 | mA |
| I_I | Input pin leakage current | $V_{IN} = V_{CCIO max}$ to 0 V | -15 | - | 15 | μ A |
| I_{OZ} | I/O pin leakage current | $V_O = V_{CCIO max}$ to 0 V | -15 | - | 15 | μ A |
| C_P | Capacitance for TMS and TCK | - | - | - | 16 | pF |
| C_{PIO} | Capacitance for all other pins except TMS and TCK | - | - | - | 8 | pF |

Note

5. Device operation guaranteed for a supply rate > 1 V / μ s.

I/O Characteristics

(Over the operating range)

| I/O standard | Nominal I/O supply voltage | Input Voltage (V) | | Output voltage (V) | | Output Current (mA) | |
|--------------|----------------------------|-----------------------|-----------------------|-----------------------|--------------------------|-----------------------|-----------------------|
| | | V _{IL} (max) | V _{IH} (min) | V _{OL} (max) | V _{OH} (min) | I _{OL} (max) | I _{OH} (max) |
| LVC MOS33 | 3.3 V | 0.80 | 2.20 | 0.45 | 2.40 | 24 | 24 |
| LVC MOS18 | 1.8 V | 30% V _{CCIO} | 65% V _{CCIO} | 0.45 | V _{CCIO} - 0.45 | 16 | 16 |

Latency Table

| Latency Parameter | Number of cycles | Detail |
|--|-------------------------|---|
| L _{FF_ASSERT} | Max = 4 | Last data write to FF going low. |
| L _{EF_ASSERT} | 0 | Last data read to EF going low. |
| L _{PRS_TO_ACTIVE} | 32 ^[6] | PRS deassert to normal operation. |
| L _{MAILBOX} | 2 | Latency from write port to read port when MB = 1 (wrt WCLK). |
| L _{REN_TO_DATA} | 4 | Latency when REN is asserted low to first data output from FIFO. |
| L _{REN_TO_CONFIG} | 4 | Latency when REN is asserted along with LD to first data read from configuration registers. |
| L _{WEN_TO_PAE_HI} | 5 ^[6] | Write to PAE going high. |
| L _{WEN_TO_PAF_LO} | 5 ^[6] | Write to PAF going low. |
| L _{REN_TO_PAE_LO} | 7 ^[6] | Read to PAE going low. |
| L _{REN_TO_PAF_HI} | 7 ^[6] | Read to PAF going high. |
| L _{FF_DEASSERT} | 8 ^[6] | Read to FF going high. |
| L _{RT_TO_REN} | 17 | First RCLK posedge after RT goes low to initiation of reads by pulling REN low. Flags update within this period after initiation of a retransmit operation. |
| L _{RT_TO_DATA} | Max = 21 ^[6] | First RCLK posedge after RT goes LOW to valid data on Q[35:0]. |
| L _{IN} | Max = 26 ^[6] | Initial latency for data read after FIFO goes empty during simultaneous read/write. |
| L _{EF_DEASSERT} | Max = 24 ^[6] | Write to EF going high. |
| L _{FF_RELEASE} ^[7] | Max = 6 | EF going low to FF deassert during retransmit reads. |

Note

6. These latency values are valid for a clock ratio of 1.

7. **Errata:** Refer to [Errata](#) on page 31 for details on flag operation and full boundary freezing during Mark and Retransmit operation.

Errata

This section describes the errata for the 18-Mbit, 36-Mbit, and 72-Mbit programmable FIFOs. Details include errata trigger conditions, scope of impact, available workaround, and silicon revision applicability. Contact your local Cypress Sales Representative or raise a technical support case at www.cypress.com/support if you have questions.

Part Numbers Affected

| Part Number | Device Characteristics |
|---------------------|--|
| CYF0018V33L-133BGXI | 18-Mbit Programmable Single-Queue FIFOs (3.3-V LVCMOS) |
| CYF0018V18L-133BGXI | 18-Mbit Programmable Single-Queue FIFO (1.8-V LVCMOS) |
| CYF0036V33L-133BGXI | 36-Mbit Programmable Single-Queue FIFO (3.3-V LVCMOS) |
| CYF0072V33L-133BGXI | 72-Mbit Programmable Single-Queue FIFO (3.3-V LVCMOS) |
| CYF0072V18L-133BGXI | 72-Mbit Programmable Single-Queue FIFO (1.8-V LVCMOS) |
| CYF2072V33L-100BGXI | 72-Mbit Programmable Eight-Queue FIFO (3.3-V LVCMOS) |

18-Mbit, 36-Mbit, and 72-Mbit Programmable FIFO Qualification Status

Product Status: In Production

18-Mbit, 36-Mbit, and 72-Mbit Programmable FIFO Errata Summary

This table defines the errata applicability to available 18-Mbit, 36-Mbit, and 72-Mbit Programmable FIFO family devices.

| Items | Part Numbers | Fix Status |
|---------------------|--|--|
| 1. Retransmit Issue | CYF0018V, CYF0036V, CYF0072V, CYF2072V | Fix in progress. Fixed devices to be available from February 04, 2013 |

1. Retransmit Issue

■ Problem Definition

Flag Failure during Retransmit cycles: Flags ($\overline{\text{PAE}}$, $\overline{\text{HF}}$, $\overline{\text{PAF}}$, and $\overline{\text{FF}}$) are not updated during a retransmit cycle. These flags do not recover on completion of retransmit cycles. The functionality of Empty Flag (EF) and Data Valid signal (DVal) remain intact throughout device operation.

■ Parameters Affected

Because flags ($\overline{\text{PAE}}$, $\overline{\text{HF}}$, $\overline{\text{PAF}}$, and $\overline{\text{FF}}$) are not updated during a retransmit cycle, their associated latencies and timing parameters are not applicable.

■ Trigger Condition

Initiation of a retransmit cycle using RT signal.

■ Scope of Impact

On initiation of a retransmit cycle, flags ($\overline{\text{PAE}}$, $\overline{\text{HF}}$, $\overline{\text{PAF}}$, and $\overline{\text{FF}}$) may not accurately reflect FIFO status. Customer applications relying on these flags to keep track of number of words in the FIFO during retransmit may observe errors because these flags are not updated. The failure mandates a reset cycle (Partial Reset for Single queue and Master Reset for Multi queue devices) to ensure flag recovery after a retransmit cycle, that is, to restore flag functionality and resume normal FIFO operations after completion of retransmit cycles.

■ Workaround

During retransmit cycles, there is no workaround to restore $\overline{\text{PAE}}$, $\overline{\text{HF}}$, $\overline{\text{PAF}}$, and $\overline{\text{FF}}$ functionalities.

After completion of retransmit cycles, a reset cycle (Partial Reset for Single queue and Master Reset for Multi queue devices) can be performed to restore PAE, HF, PAF, and FF functionalities for normal FIFO operation.

■ Fix Status

The fix for the retransmit issue is in progress. In devices with the design fix, the intended flag functionality will be restored during retransmit cycles. Reset will not be mandatory after a retransmit cycle to resume normal FIFO operation. Fixed devices will be available from February 04, 2013.

| Revision | ECN | Orig. of Change | Submission Date | Description of Change |
| *G | 3129722 | HKV | 01/06/2011 | Post to external web. |
| *H | 3197271 | SIVS | 03/31/2011 | <p>Removed 144 Mbit parts from the data sheet</p> <p>Removed multi-queue information from data sheet</p> <p>Removed 2.5 V and 1.5 V options</p> <p>Removed HSTL I/II I/O standard</p> <p>Added clock ratio requirement between RCLK and WCLK</p> <p>Removed redundant Xs from part number to improve readability</p> <p>Removed tie to GND option on DNU pins in pin description</p> <p>Added information on Flag operations to add clarity</p> <p>Added explanation for flow-through mailbox operation</p> <p>Added details on active pins in various port sizes in Table 1.</p> <p>Added Configuration register write to normal operation latency details.</p> <p>Changed configuration register definitions and default values</p> <p>Changed number of unusable locations to four to eight</p> <p>Added JTAG related operation</p> <p>Added latch-up current parameter in maximum operating conditions.</p> <p>Removed 2.5 V and 1.5 V options from DC operating condition table 6.</p> <p>Removed 110 MHz part details and added Cpio parameter in table 7.</p> <p>Removed 2.5 V and 1.5 V options from Table 8.</p> <p>Added latency parameters in Table 9.</p> <p>changed $V_{OL(max)}$ value of LVCMOS33 in table11</p> <p>Removed 110 MHz part detail from switching characteristics</p> <p>Added timing waveform to improve clarity.</p> <p>Modified ordering information and definition.</p> |
| *I | 3388143 | AJU | 09/29/2011 | <p>Updated Pin Diagram for CYF0XXXVXXL [1] (Added Note 2 and referred the same note in DNU in ball U6).</p> <p>Updated Programming Flag Offsets and Configuration Registers (Updated Table 4 (WCLK column in first row)).</p> <p>Updated Recommended DC Operating Conditions (Added Note 5 and referred the same note in Parameter column).</p> <p>Updated Latency Table (Changed Details for the parameters $L_{\overline{WEN_TO_PAE_HI}}$ and $L_{\overline{REN_TO_PAE_LO}}$).</p> <p>Updated Switching Waveforms (Removed the clock cycle numbers in Figure 12, Figure 13, Figure 17, and Figure 19).</p> <p>Updated Package Diagram.</p> <p>Updated in new template.</p> |
| *J | 3652368 | ADMU | 08/16/2012 | <p>Updated Pin Diagram for CYF0XXXVXXL [1] (Updated Figure 1 on page 4 (W9 ball marked as DNU)).</p> <p>Added Figure 5 (Test Load Conditions).</p> <p>Updated Switching Characteristics (Changed minimum values of t_{S_JTAG}, t_{H_JTAG} parameters from 5 ns to 8 ns, changed maximum value of t_{CO_JTAG} parameter from 10 ns to 20 ns).</p> |
| *K | 3735896 | ADMU | 09/07/2012 | <p>Updated package diagram 51-85167 to *C</p> <p>Updated "Output current into outputs (LOW)" parameter under Maximum Ratings section from 20 mA to 24 mA.</p> |

| Document Title: CYF0018V/CYF0036V/CYF0072V, 18/36/72-Mbit Programmable FIFOs Document Number: 001-53687 | | | | |
|--|---------|-----------------|-----------------|--|
| Revision | ECN | Orig. of Change | Submission Date | Description of Change |
| *L | 3940217 | ADMU | 03/22/2013 | <p>Updated Features.</p> <p>Updated Functional Description.</p> <p>Updated Logic Block Diagram.</p> <p>Updated Pin Diagram for CYF0XXXVXXL [1]: Added Note 1 and referred the same note in Figure 1.</p> <p>Updated Pin Definitions.</p> <p>Updated Architecture: Updated Reset Logic, Data Valid Signal (DVal), Flag Operation, Retransmit from Mark Operation, Programming Flag Offsets and Configuration Registers, Read/Write Clock Requirements. Added Table 2.</p> <p>Updated Latency Table.</p> <p>Updated Switching Waveforms: Updated Figure 12, Figure 13, Figure 17, Figure 19, Figure 20, Figure 21, Figure 22, Figure 24. Added Note 9 and referred the same note in $\overline{WEN} / \overline{IE}$ in Figure 20. Added Note 10 and referred the same note in WEN / \overline{IE} in Figure 21.</p> <p>Updated Ordering Information (Updated part numbers).</p> |
| *M | 3997615 | ADMU | 05/11/2013 | <p>Added Errata.</p> |
| *N | 4078255 | ADMU | 07/26/2013 | <p>Added Errata footnotes (Note 4, 7, 8, 11).</p> <p>Updated Architecture: Updated Retransmit from Mark Operation: Added Note 4 and referred the same note in 2nd paragraph and last paragraph.</p> <p>Updated Latency Table: Added Note 7 and referred the same note in "$L_{FF_RELEASE}$" parameter.</p> <p>Updated Switching Waveforms: Added Note 8 and referred the same note in "$L_{FF_RELEASE}$" in Figure 17. Added Note 11 and referred the same note in "All Flags" and "FLAGS UPDATED AFTER RT" in Figure 24.</p> <p>Updated in new template.</p> |

Sales, Solutions, and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at [Cypress Locations](#).
