Note 2: Absolute Maximum Ratings are values beyond which the device may be damaged or have its useful life impaired. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. Fairchild does not recommend operation outside databook specifications.

Note 3: When Outputs are in OFF-State OR when  $V_{\mbox{CC}}$  = 0V.

Note 4: HIGH or LOW state  $\mathbf{I}_{\text{OUT}}$  absolute maximum rating must be observed.

Note 5:  $V_{OUT} <\!\! GND, V_{OUT} > V_{CC}$  (Outputs Active).

Note 6: Unused inputs must be held HIGH or LOW. They may not float.
