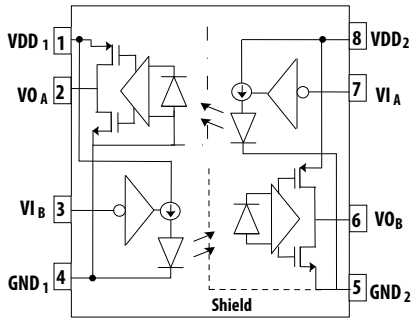
Description

The ACSL-7210 is a dual-channel bidirectional 25 MBd digital optocoupler utilizes CMOS IC technology and patented packaging technologies to achieve high isolation voltage 3750 V_{RMS} in a < 2 mm low profile narrow-body SOIC-8 package. The device optimizes for bidirectional industrial communication networks such as Fieldbus (PROFIBUS) and Serial Peripheral Interface (SPI) applications.

The main building blocks of the ACSL-7210 for each channel are a CMOS LED driver IC that is controlled by a CMOS logic input signal, a high speed LED, and a CMOS detector IC. These building blocks allow fast propagation delay of 40 ns and short pulse width distortion of 10 ns maximum.

The ACSL-7210 has common-mode noise immunity of typical 35 kV/µs at 1000 V_{CM}, with UL recognized with isolation voltage of 3750 V_{RMS} for 1 minute, and IEC/EN/DIN EN 60747-5-5 working insulation voltage V_{IORM} of 567 V_{PEAK} with reinforced insulation.

Functional Diagram



ACSL-7210

* A 0.1 µF bypass capacitor must be connected between pins V_{DD1} and GND_1, and V_{DD2} and GND_2

Features

- Dual-Channel (Opposite direction orientation)
- High Speed: DC to 25 MBd
- 3.3 V and 5 V CMOS Compatibility
- CMOS input and output
- 25 kV/µs minimum Common Mode Rejection (CMR) at V_{CM} = 1000 V
- Guaranteed AC and DC performance over wide temperature: –40 °C to +105 °C
- Safety and Regulatory Approvals: (pending):
  - UL 1577 – 3750 V_{rms} for 1 minute
  - IEC/EN/DIN EN 60747-5-5 for Reinforced Insulation – 567 V_{PEAK}

Applications

- Digital Fieldbus Isolation: PROFIBUS, CC-Link, DeviceNet, SDS
- Multiplexed Data Transmission
- General Instrument and Data Acquisition
- Computer Peripheral Interface
- Microprocessor System Interface

Regulatory Information

The ACSL-7210 will be approved by the following organizations:

UL

Approval under UL 1577, component recognition program up to VISO = 3750 VRMS.

CSA

Approval under CSA Component Acceptance Notice #5.

Notes:
1. Per channel.
2. LED is ON when V_I is low and OFF when V_I is high.
3. t_{PHL} propagation delay is measured from the 50% level on the falling edge of the V_I signal to the 50% level of the falling edge of the V_O signal. t_{PLH} propagation delay is measured from the 50% level on the rising edge of the V_I signal to the 50% level of the rising edge of the V_O signal.
4. PWD is defined as $\lvert t_{PHL} - t_{PLH} \rvert$.
5. t_{PSK} is equal to the magnitude of the worst case difference in t_{PHL} and/or t_{PLH} that will be seen between units at any given temperature within the recommended operating conditions.
6. CMH is the maximum common mode voltage slew rate that can be sustained while maintaining V_O > 0.8 V_{DD2}. CML is the maximum common mode voltage slew rate that can be sustained while maintaining V_O < 0.8 V. The common mode voltage slew rates apply to both rising and falling common mode voltage edges.
7. Device is considered a two-terminal device: pins 1, 2, 3, and 4 are shorted together and pins 5, 6, 7, and 8 are shorted together.
8. In accordance with UL1577, ACSL-7210 is proof-tested by applying an insulation test voltage ≥ 4500 V_{RMS} for 1 second (leakage detection current limit, I_{I-O} ≤ 5 µA).
9. The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating, refer to your equipment level safety specification or Avago Technologies Application Note 1074 entitled "Optocoupler Input-Output Endurance Voltage."
10. C_I is the capacitance measured at pin 3 or pin 7 (V_I).

Application Information

Bypassing and PC Board Layout

The ACSL-7210 optocoupler is extremely easy to use. No external interface circuitry is required because ACSL-7210 uses high-speed CMOS IC technology, allowing CMOS logic to be directly connected to the inputs and outputs.

The only external components required for proper operation are two bypass capacitors. Capacitor value should be between 0.01 µF and 0.1 µF. For each capacitor, the total lead length between both ends of the capacitor and the power supply pins should not exceed 20 mm.

Figure 8 shows the typical application diagram for 25 MBd bidirectional ACSL-7210 and 10 MBd ultra low-power ACPL-M61L, providing isolation in PROFIBUS (RS485) communication. ACSL-7210 isolates the transmitting and receiving data channels while ACPL-M61L isolates the transmit enable signal.

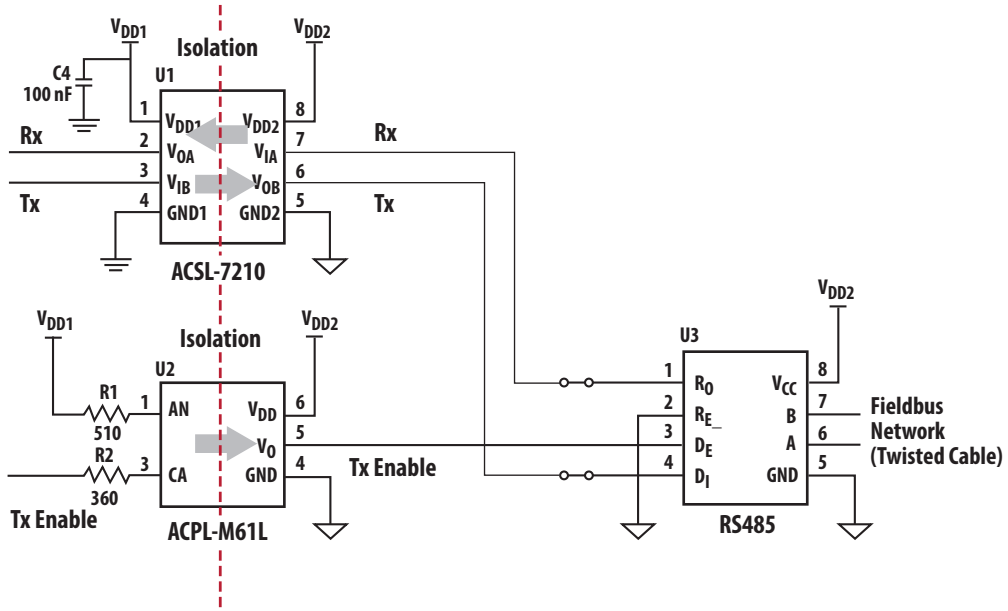

Figure 8. Isolated PROFIBUS (RS485) communication with ACSL-7210 and ACPL-M61L

For the SPI interface, the ACSL-7210 is used for serial data in/out isolation (2 channels bidirectional). The third channel - clock signal isolation is provided by ACPL-077L, 25 MBd CMOS digital optocoupler. Figure 9 shows the SPI isolated communication between master and slave devices using ACSL-7210 and ACPL-077L.
