### Description

The PI3L110 is a 8- to 4-bit multiplexer/demultiplexer LAN Switch with Hi-Z outputs. Industry leading advantages include a propagation delay of less than 250ps, resulting from its low channel resistance and I/O capacitance. The device multiplexes differential outputs from a Fast Ethernet transceiver (PHY) device to one of two corresponding outputs. The switch is bidirectional and offers little or no attenuation of the high-speed signals at the outputs. It is designed for low bit-to-bit skew, high channel-to-channel noise isolation and is compatible with various standards, such as 10/100 Base-T (Ethernet).

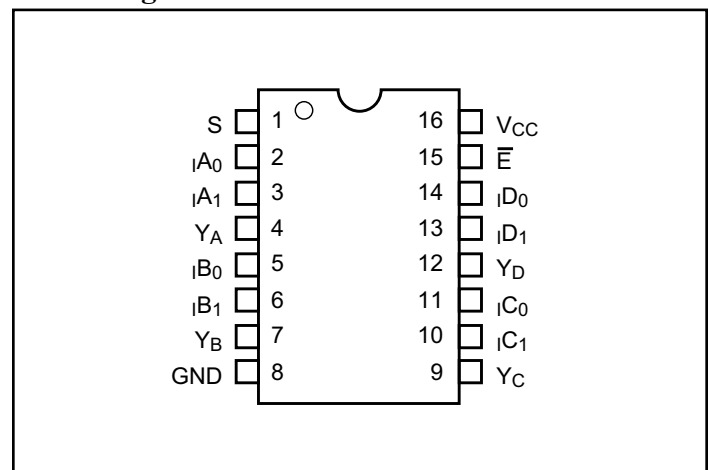

Generally, this part can be used to replace mechanical relays in low-voltage LAN applications that interface a physical layer over CAT 5 or CAT 6 unshielded twisted pair cable through an isolation transformer.

The PI3L110 is fully specified for partial-power-down applications using  $I_{OFF}$ . The  $I_{OFF}$  feature ensures that damaging current will not backflow throughout the device when it is powered down. The device has isolation during Power Off.

**Notes:**

- For max. or min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
- Typical values are at V<sub>CC</sub> = 3.3V, T<sub>A</sub> = 25°C ambient and maximum loading.
- Measured by the voltage drop between I<sub>N</sub> and Y<sub>N</sub> pins at indicated current through the switch. On-Resistance is determined by the lower of the voltages on the two (I<sub>N</sub> & Y<sub>N</sub>) pins.
- This parameter is determined by device characterization but is not production tested.

### Dynamic Electrical Characteristics Over the Operating Range

### Characteristics

Parameter	Description	Test Conditions	Min.	Typ. <sup>(1)</sup>	Max.	Units
$t_{PD}$	Propagation Delay <sup>(2,3)</sup>			0.25		ns
$t_{PZH}, t_{PZL}$	Line Enable Time - S or $\bar{E}$ to $Y_N, I_N$		0.5		15	
$t_{PHZ}, t_{PLZ}$	Line Disable Time - S to $\bar{E}$ to $Y_N, I_N$		0.5		9	
$t_{SK(p)}$	Skew between opposite transitions of the same output ( $t_{PHL} - t_{PLH}$ ) <sup>(2)</sup>			0.1	0.2	

**Notes:**

- For max. or min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
- Guaranteed by design.
- The bus switch contributes no propagational delay other than the RC delay of the On-Resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25ns for 10pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interactions with the load on the driven side.

### Test Circuit for Electrical Characteristics

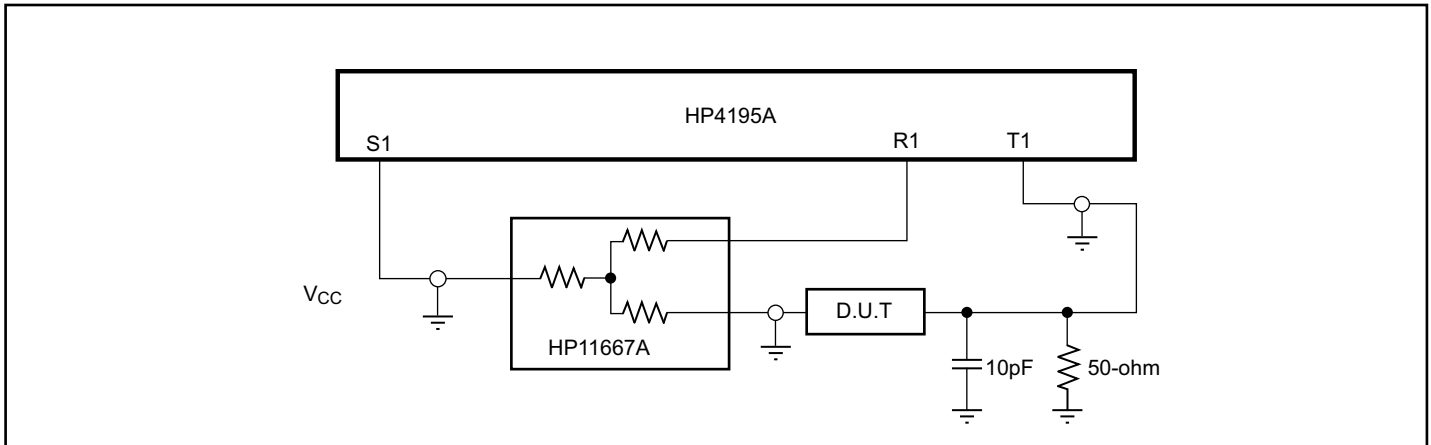

**Notes:**

- $C_L$  = Load capacitance: includes jig and probe capacitance.
- $R_T$  = Termination resistance: should be equal to  $Z_{OUT}$  of the Pulse Generator
- Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control.
- Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
- All input impulses are supplied by generators having the following characteristics:  $PRR \leq 10$  MHz,  $Z_O = 50\Omega$ ,  $t_R \leq 2.5$ ns,  $t_F \leq 2.5$ ns.
- The outputs are measured one at a time with one transition per measurement.

#### Logic Inputs

The logic control inputs can be driven up to +3.6V regardless of the supply voltage. For example, given a +3.3V supply, the output enables or select pins may be driven low to 0V and high to 3.6V. Driving the control inputs Rail-to-Rail<sup>®</sup> minimizes power consumption.
