

4-line ESD protection for high speed lines

Datasheet – production data

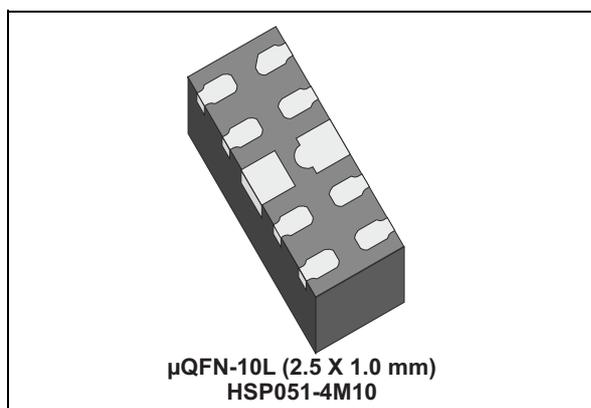

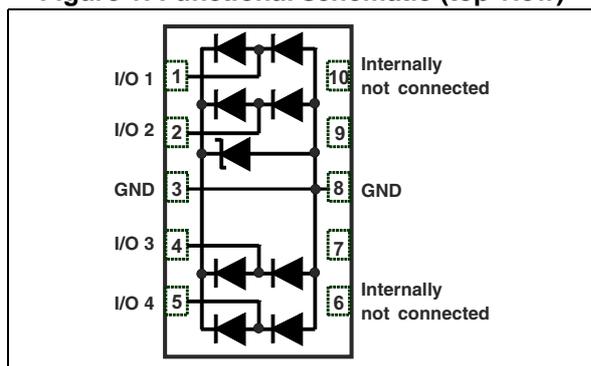

Figure 1. Functional schematic (top view)

Features

- Flow-through routing to keep signal integrity
- Ultralarge bandwidth: 10 GHz
- Ultralow capacitance:
 - 0.2 pF (I/O to I/O)
 - 0.35 pF (I/O to GND)
- Very Low dynamic resistance: 0.48 Ω
- 100 Ω differential impedance
- Low leakage current: 100 nA at 25 °C
- Extended operating junction temperature range: -40 °C to 150 °C
- Thin package: 0.5 mm max.
- RoHS compliant

Benefits

- High ESD protection level
- High integration
- Suitable for high density boards

Complies with following standards

- MIL-STD 883G Method 3015-7 Class 3B:
 - 8 kV
- IEC 61000-4-2 level 4:
 - 8 kV (contact discharge)
 - 15 kV (air discharge)

Applications

The HSP051-4M10 is designed to protect against electrostatic discharge on sub micron technology circuits driving:

- HDMI 2.0 and 1.4
- USB 3.1 and USB3.0
- Digital Video Interface
- Display Port
- Serial ATA

Description

The HSP051-4M10 is a 4-channel ESD array with a rail to rail architecture designed specifically for the protection of high speed differential lines.

The ultralow variation of the capacitance ensures very low influence on signal-skew. The large bandwidth make it compatible with HDMI2.0. 4k/2k (=5.94 Gbps) and USB3.1 (= 10 Gbps).

The device is packaged in μQFN 2.5 mm x 1 mm with a 500 μm pitch.

3 Recommendation on PCB assembly

Figure 20. Recommended stencil window position

3.1 Solder paste

1. Use halide-free flux, qualification ROL0 according to ANSI/J-STD-004.
2. "No clean" solder paste recommended.
3. Offers a high tack force to resist component displacement during PCB movement.
4. Use solder paste with fine particles: powder particle size 20-45 µm.

3.2 Placement

1. Manual positioning is not recommended.
2. It is recommended to use the lead recognition capabilities of the placement system, not the outline centering.
3. Standard tolerance of ± 0.05 mm is recommended.
4. 3.5 N placement force is recommended. Too much placement force can lead to squeezed out solder paste and cause solder joints to short. Too low placement force

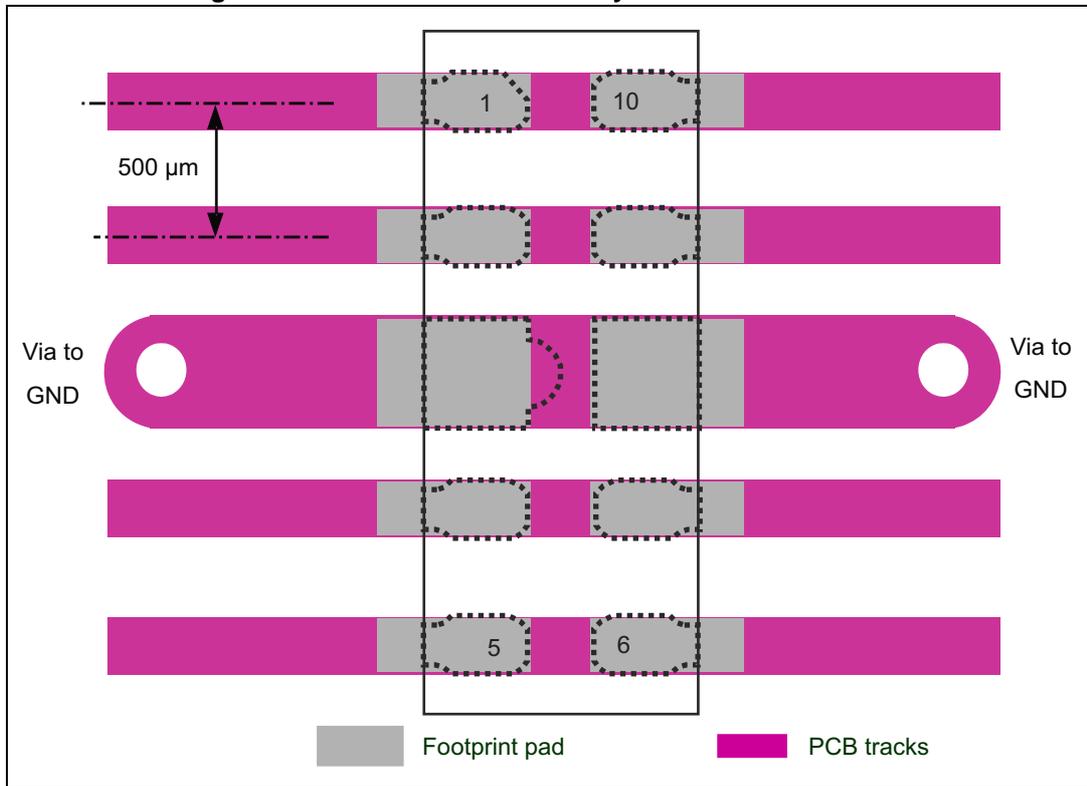

can lead to insufficient contact between package and solder paste that could cause open solder joints or badly centered packages.

- 5. To improve the package placement accuracy, a bottom side optical control should be performed with a high resolution tool.
- 6. For assembly, a perfect supporting of the PCB (all the more on flexible PCB) is recommended during solder paste printing, pick and place and reflow soldering by using optimized tools.

3.3 PCB design

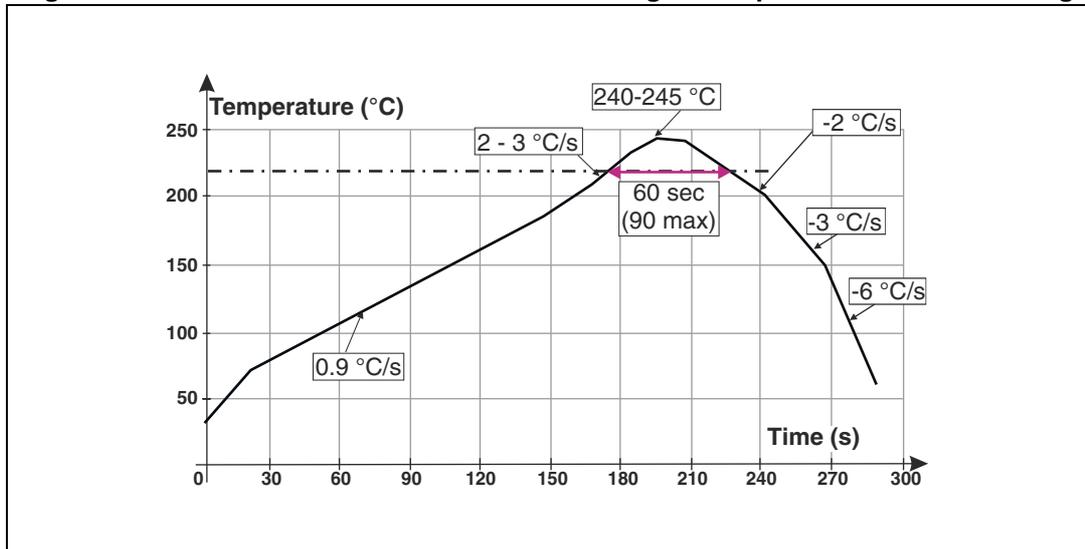

- 1. To control the solder paste amount, the closed via is recommended instead of open vias.
- 2. The position of tracks and open vias in the solder area should be well balanced. The symmetrical layout is recommended, in case any tilt phenomena caused by asymmetrical solder paste amount due to the solder flow away.

3.4 Reflow profile

Note: Minimize air convection currents in the reflow oven to avoid component movement. Maximum soldering profile corresponds to the latest IPC/JEDEC J-STD-020.
