

**CY7C4261V/CY7C4271V**  
**CY7C4281V/CY7C4291V**

**16 K / 32 K / 64 K / 128 K × 9**  
**Low-Voltage Deep Sync™ FIFOs**

**Features**

- 3.3 V operation for low-power consumption and easy integration into low-voltage systems
- High-speed, low-power, first-in first-out (FIFO) memories
- 16 K × 9 (CY7C4261V)
- 32 K × 9 (CY7C4271V)
- 64 K × 9 (CY7C4281V)
- 128 K × 9 (CY7C4291V)
- 0.35-micron CMOS for optimum speed or power
- High-speed 100-MHz operation (10-ns read/write cycle times)
- Low power
  - I<sub>CC</sub> = 25 mA
  - I<sub>SB</sub> = 4 mA
- Fully asynchronous and simultaneous read and write operation
- Empty, full, and programmable Almost Empty and Almost Full status flags
- Output-enable ( $\overline{OE}$ ) pin
- Independent read- and write-enable pins
- Supports free-running 50% duty cycle clock inputs
- Width-expansion capability
- Pin-compatible 3.3 V solutions for CY7C4261/71/81/91
- Pin-compatible density upgrade within the CY7C42X1V family
- Pb-free packages available

**Functional Description**

The CY7C4261/71/81/91V are high-speed, low-power FIFO memories with clocked read and write interfaces. All are nine bits wide. The CY7C4261/71/81/91V are pin-compatible with the lower densities in the CY7C42X1V Synchronous FIFO family. Programmable features include Almost Full/Almost Empty flags. These FIFOs provide solutions for a wide variety of data

buffering needs, including high-speed data acquisition, multiprocessor interfaces, and communications buffering.

These FIFOs have 9-bit input and output ports that are controlled by separate clock and enable signals. The input port is controlled by a free-running clock (WCLK) and two write-enable pins (WEN1, WEN2/LD).

When WEN1 is LOW and WEN2/LD is HIGH, data is written into the FIFO on the rising edge of the WCLK signal. While WEN1 and WEN2/LD are held active, data is continually written into the FIFO on each WCLK cycle. The output port is controlled in a similar manner by a free-running read clock (RCLK) and two read-enable pins (REN1, REN2). In addition, the CY7C4261/71/81/91V has an output-enable pin (OE). The read (RCLK) and write (WCLK) clocks may be tied together for single-clock operation or the two clocks may be run independently for asynchronous read/write applications. Clock frequencies up to 100 MHz are achievable. Depth expansion is possible using one enable input for system control, while the other enable is controlled by expansion logic to direct the flow of data.

The CY7C4261/71/81/91V provides four status pins: Empty, Full, Programmable Almost Empty, and Programmable Almost Full. The Almost Empty/Almost Full flags are programmable to single word granularity. The programmable flags default to Empty +7 and Full -7.

The flags are synchronous, that is, they change state relative to either the read clock (RCLK) or the write clock (WCLK). When entering or exiting the Empty and Almost Empty states, the flags are updated exclusively by the RCLK. The flags denoting Almost Full, and Full states are updated exclusively by WCLK. The synchronous flag architecture guarantees that the flags maintain their status for at least one cycle.

All configurations are fabricated using an advanced 0.35 μ CMOS technology. Input ESD protection is greater than 2001 V, and latch-up is prevented by the use of guard rings.

## Pin Configuration

## Pin Definitions

Pin No.	Signal Name	Description	I/O	Description
1–6, 30–32	D <sub>0-8</sub>	Data inputs	I	Data inputs for 9-bit bus.
16–24	Q <sub>0-8</sub>	Data outputs	O	Data outputs for 9-bit bus.
28	WEN1	Write enable 1	I	The only write enable when device is configured to have programmable flags. Data is written on a LOW-to-HIGH transition of WCLK when WEN1 is asserted and FF is HIGH. If the FIFO is configured to have two write enables, data is written on a LOW-to-HIGH transition of WCLK when WEN1 is LOW and WEN2/LD and FF are HIGH.
26	WEN2/LD Dual mode pin	Write enable 2 Load	I	If HIGH at reset, this pin operates as a second write enable. If LOW at reset, this pin operates as a control to write or read the programmable flag offsets. WEN1 must be LOW and WEN2 must be HIGH to write data into the FIFO. Data will not be written into the FIFO if the FF is LOW. If the FIFO is configured to have programmable flags, WEN2/LD is held LOW to write or read the programmable flag offsets.
10, 12	REN1, REN2	Read enable inputs	I	Enables the device for Read operation. Both REN1 and REN2 must be asserted to allow a read operation.
27	WCLK	Write clock	I	The rising edge clocks data into the FIFO when WEN1 is LOW and WEN2/LD is HIGH and the FIFO is not full. When LD is asserted, WCLK writes data into the programmable flag-offset register.
11	RCLK	Read clock	I	The rising edge clocks data out of the FIFO when REN1 and REN2 are LOW and the FIFO are not Empty. When WEN2/LD is LOW, RCLK reads data out of the programmable flag-offset register.
14	EF	Empty flag	O	When EF is LOW, the FIFO is empty. EF is synchronized to RCLK.
15	FF	Full flag	O	When FF is LOW, the FIFO is full. FF is synchronized to WCLK.
8	PAE	Programmable almost empty	O	When PAE is LOW, the FIFO is almost empty based on the almost empty offset value programmed into the FIFO. PAE is synchronized to RCLK.
7	PAF	Programmable almost full	O	When PAF is LOW, the FIFO is almost full based on the almost full offset value programmed into the FIFO. PAF is synchronized to WCLK.
29	RS	Reset	I	Resets device to empty condition. A reset is required before an initial read or write operation after power-up.
13	OE	Output enable	I	When OE is LOW, the FIFO's data outputs drive the bus to which they are connected. If OE is HIGH, the FIFO's outputs are in High Z (high-impedance) state.

## Architecture

The CY7C4261/71/81/91V consists of an array of 16 K, 32 K, 64 K, or 128 K words of nine bits each (implemented by a dual-port array of SRAM cells), a read pointer, a write pointer, control signals (RCLK, WCLK, REN1, REN2, WEN1, WEN2, RS), and flags (EF, PAE, PAF, FF).

## Resetting the FIFO

Upon power-up, the FIFO must be reset with a Reset ( $\overline{RS}$ ) cycle. This causes the FIFO to enter the Empty condition signified by  $\overline{EF}$  being LOW. All data outputs ( $Q_{0-8}$ ) go LOW  $t_{RSF}$  after the rising edge of RS. In order for the FIFO to reset to its default state, the user must not read or write while RS is LOW. All flags are guaranteed to be valid  $t_{RSF}$  after  $\overline{RS}$  is taken LOW.

## FIFO Operation

When the  $\overline{WEN1}$  signal is active LOW, WEN2 is active HIGH, and FF is active HIGH, data present on the  $D_{0-8}$  pins is written into the FIFO on each rising edge of the WCLK signal. Similarly, when the REN1 and REN2 signals are active LOW and  $\overline{EF}$  is active HIGH, data in the FIFO memory will be presented on the  $Q_{0-8}$  outputs. New data will be presented on each rising edge of RCLK while REN1 and REN2 are active. REN1 and REN2 must set up  $t_{ENS}$  before RCLK for it to be a valid read function. WEN1 and WEN2 must occur  $t_{ENS}$  before WCLK for it to be a valid write function.

An output enable ( $\overline{OE}$ ) pin is provided to three-state the  $Q_{0-8}$  outputs when  $\overline{OE}$  is asserted. When  $\overline{OE}$  is enabled (LOW), data in the output register will be available to the  $Q_{0-8}$  outputs after  $t_{OE}$ . If devices are cascaded, the  $\overline{OE}$  function will only output data on the FIFO that is read enabled.

The FIFO contains overflow circuitry to disallow additional writes when the FIFO is full, and underflow circuitry to disallow additional reads when the FIFO is empty. An empty FIFO maintains the data of the last valid read on its  $Q_{0-8}$  outputs even after additional reads occur.

**Write Enable 1 (WEN1).** If the FIFO is configured for programmable flags, Write Enable 1 (WEN1) is the only write enable control pin. In this configuration, when Write Enable 1 (WEN1) is LOW, data can be loaded into the input register and RAM array on the LOW-to-HIGH transition of every write clock (WCLK). Data is stored in the RAM array sequentially and independently of any on-going read operation.

**Write Enable 2/Load (WEN2/LD).** This is a dual-purpose pin. The FIFO is configured at Reset to have programmable flags or to have two write enables, which allows for depth expansion. If Write Enable 2/Load (WEN2/LD) is set active HIGH at Reset ( $RS = LOW$ ), this pin operates as a second write enable pin.

If the FIFO is configured to have two write enables, when Write Enable (WEN1) is LOW and Write Enable 2/Load (WEN2/LD) is HIGH, data can be loaded into the input register and RAM array on the LOW-to-HIGH transition of every write clock (WCLK). Data is stored in the RAM array sequentially and independently of any on-going read operation.

## Programming

When WEN2/LD is held LOW during Reset, this pin is the load (LD) enable for flag offset programming. In this configuration, WEN2/LD can be used to access the four 9-bit offset registers contained in the CY7C4261/71/81/91V for writing or reading data to these registers.

When the device is configured for programmable flags and both WEN2/LD and WEN1 are LOW, the first LOW-to-HIGH transition of WCLK writes data from the data inputs to the empty offset least significant bit (LSB) register. The second, third, and fourth LOW-to-HIGH transitions of WCLK store data in the empty offset most significant bit (MSB) register, full offset LSB register, and full offset MSB register, respectively, when WEN2/LD and WEN1 are LOW. The fifth LOW-to-HIGH transition of WCLK while WEN2/LD and WEN1 are LOW writes data to the empty LSB register again. Figure 1 shows the registers sizes and default values for the various device types.

**Figure 1. Offset Register Location and Default Values**

It is not necessary to write to all the offset registers at one time. A subset of the offset registers can be written; then by bringing the WEN2/LD input HIGH, the FIFO is returned to normal read and write operation. The next time WEN2/LD is brought LOW, a write operation stores data in the next offset register in sequence.

The contents of the offset registers can be read to the data outputs when WEN2/LD is LOW and both REN1 and REN2 are LOW. LOW-to-HIGH transitions of RCLK read register contents to the data outputs. Writes and reads should not be performed simultaneously on the offset registers.

**Programmable Flag ( $\overline{\text{PAE}}$ ,  $\overline{\text{PAF}}$ ) Operation**

Whether the flag offset registers are programmed as described in Table 1 or the default values are used, the programmable almost-empty flag ( $\overline{\text{PAE}}$ ) and programmable almost-full flag ( $\overline{\text{PAF}}$ ) states are determined by their corresponding offset registers and the difference between the read and write pointers.

**Table 1. Writing the Offset Registers<sup>[1]</sup>**

LD	WEN	WCLK	Selection
0	0		Empty offset (LSB) ← Empty offset (MSB) → Full offset (LSB) Full offset (MSB)
0	1		No operation
1	0		Write into FIFO
1	1		No operation

The number formed by the empty offset least significant bit register and empty offset most significant bit register is referred to as *n* and determines the operation of  $\overline{\text{PAE}}$ .  $\overline{\text{PAE}}$  is synchronized to the LOW-to-HIGH transition of RCLK by one flip-flop and is LOW when the FIFO contains *n* or fewer unread words.  $\overline{\text{PAE}}$  is set HIGH by the LOW-to-HIGH transition of RCLK when the FIFO contains (*n*+1) or greater unread words.

The number formed by the full offset least significant bit register and full offset most significant bit register is referred to as *m* and determines the operation of  $\overline{\text{PAF}}$ .  $\overline{\text{PAF}}$  is synchronized to the LOW-to-HIGH transition of WCLK by one flip-flop and is set LOW when the number of unread words in the FIFO is greater than or equal to CY7C4261V (16k – *m*), CY7C4271V (32k – *m*), CY7C4281V (64k – *m*) and CY7C4291V (128k – *m*).  $\overline{\text{PAF}}$  is set HIGH by the LOW-to-HIGH transition of WCLK when the number of available memory locations is greater than *m*.

**Table 2. Status Flags**

Number of Words in FIFO				$\overline{\text{FF}}$	$\overline{\text{PAF}}$	$\overline{\text{PAE}}$	$\overline{\text{EF}}$
CY7C4261V	CY7C4271V	CY7C4281V	CY7C4291V				
0	0	0	0	H	H	L	L
1 to <i>n</i> <sup>[2]</sup>	1 to <i>n</i> <sup>[2]</sup>	1 to <i>n</i> <sup>[2]</sup>	1 to <i>n</i> <sup>[2]</sup>	H	H	L	H
( <i>n</i> + 1) to (16384 – ( <i>m</i> + 1))	( <i>n</i> + 1) to (32768 – ( <i>m</i> + 1))	( <i>n</i> + 1) to (65536 – ( <i>m</i> + 1))	( <i>n</i> + 1) to (131072 – ( <i>m</i> + 1))	H	H	H	H
(16384 – <i>m</i> ) <sup>[3]</sup> to 16383	(32768 – <i>m</i> ) <sup>[3]</sup> to 32767	(65536 – <i>m</i> ) <sup>[3]</sup> to 65535	(131072 – <i>m</i> ) <sup>[3]</sup> to 131071	H	L	H	H
16384	32768	65536	131072	L	L	H	H

**Notes**

1. The same selection sequence applies to reading from the registers.  $\overline{\text{REN1}}$  and  $\overline{\text{REN2}}$  are enabled and a read is performed on the LOW-to-HIGH transition of RCLK.
2. *n* = Empty Offset (*n* = 7 default value).
3. *m* = Full Offset (*m* = 7 default value).

## Width-Expansion Configuration

Word width may be increased simply by connecting the corresponding input controls signals of multiple devices. A composite flag should be created for each of the end-point status flags (EF and FF). The partial status flags (PAE and PAF) can be detected from any one device. *Figure 2* demonstrates a 18-bit word width by using two CY7C42x1Vs. Any word width can be attained by adding additional CY7C42x1Vs.

When the CY7C42x1V is in a Width-Expansion Configuration, the Read Enable (REN2) control input can be grounded (see *Figure 2*). In this configuration, the Write Enable 2/Load (WEN2/LD) pin is set to LOW at Reset so that the pin operates as a control to load and read the programmable flag offsets.

## Flag Operation

The CY7C4261/71/81/91V devices provide five flag pins to indicate the condition of the FIFO contents. Empty, Full, PAE, and PAF are synchronous.

### Full Flag

The Full Flag ( $\overline{FF}$ ) will go LOW when the device is full. Write operations are inhibited whenever  $\overline{FF}$  is LOW regardless of the state of WEN1 and WEN2/LD.  $\overline{FF}$  is synchronized to WCLK, i.e., it is exclusively updated by each rising edge of WCLK.

### Empty Flag

The Empty Flag ( $\overline{EF}$ ) will go LOW when the device is empty. Read operations are inhibited whenever  $\overline{EF}$  is LOW, regardless of the state of REN1 and REN2. EF is synchronized to RCLK, that is, it is exclusively updated by each rising edge of RCLK.

**Figure 2. Block Diagram of 16 K / 32 K / 64 K / 128 K × 9 Low-Voltage Deep Sync FIFO Memory Used in a Width-Expansion Configuration**

## Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Storage temperature ..... -65 °C to +150 °C  
 Ambient temperature with power applied ... -55 °C to +125 °C  
 Supply voltage to ground potential ..... -0.5 V to +3.6 V  
 DC voltage applied to outputs  
 in High-Z state ..... -0.5 V to  $V_{CC} + 0.5 V$   
 DC input voltage ..... -0.5 V to  $V_{CC} + 0.5 V$

Output current into outputs (LOW) ..... 20 mA  
 Static discharge voltage ..... > 2001 V  
 (per MIL-STD-883, Method 3015)  
 Latch-up current ..... > 200 mA

## Operating Range

Range	Ambient Temperature	$V_{CC}^{[4]}$
Commercial	0 °C to +70 °C	3.3 V $\pm$ 300 mV
Industrial	-40 °C to +85 °C	3.3 V $\pm$ 300 mV

			Industrial	-	-	-	4	mA

## Capacitance

Parameter <sup>[7]</sup>	Description	Test Conditions	Max	Unit
$C_{IN}$	Input capacitance	$T_A = 25 \text{ }^\circ\text{C}, f = 1 \text{ MHz},$ $V_{CC} = 3.3 \text{ V}$	5	pF
$C_{OUT}$	Output capacitance		7	pF

### Notes

4.  $V_{CC}$  Range for commercial -10 ns is 3.3 V  $\pm$ 150 mV.
5. Input signals switch from 0 V to 3 V with a rise/fall time of less than 3 ns, clocks and clock enables switch at maximum frequency of 20 MHz, while data inputs switch at 10 MHz. Outputs are unloaded.
6. All inputs =  $V_{CC} - 0.2 \text{ V}$ , except WCLK and RCLK (which are at frequency = 0 MHz). All outputs are unloaded.
7. Tested initially and after any design or process changes that may affect these parameters.

**AC Test Loads and Waveforms (-15 and -25)<sup>[8, 9]</sup>**

**AC Test Loads and Waveforms (-10)**

**Notes**

- 8.  $C_L = 30 \text{ pF}$  for all AC parameters except for  $t_{OHZ}$ .
- 9.  $C_L = 5 \text{ pF}$  for  $t_{OHZ}$ .

**Notes**

- 10. Pulse widths less than minimum values are not allowed.
- 11. Values guaranteed by design, not currently tested.

## Switching Waveforms

Figure 3. Write Cycle Timing

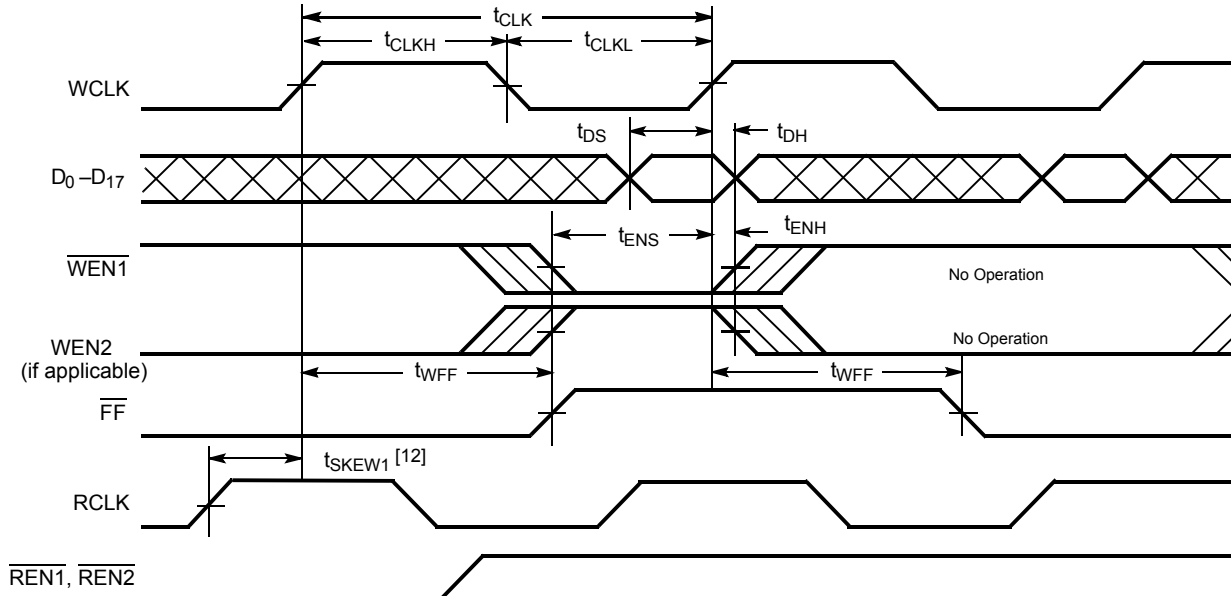

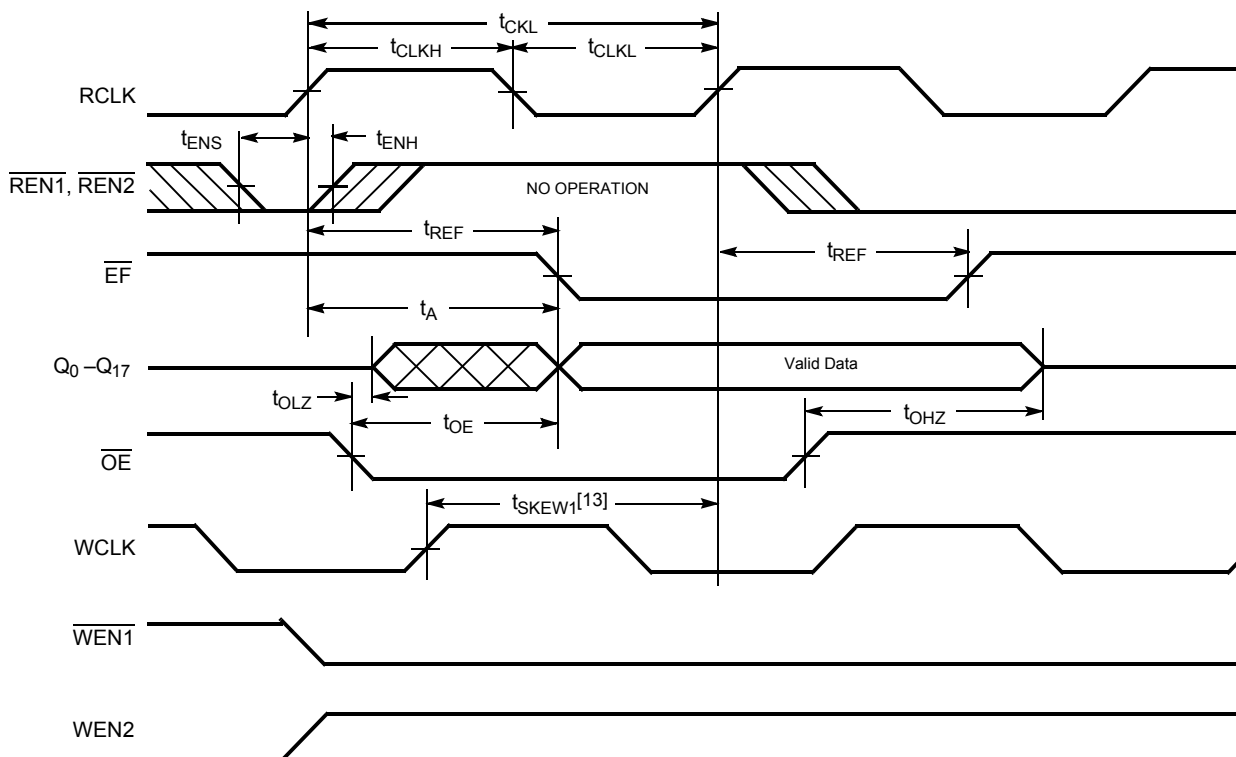

Figure 4. Read Cycle Timing

**Notes**

12.  $t_{SKEW1}$  is the minimum time between a rising RCLK edge and a rising WCLK edge to guarantee that  $\overline{FF}$  will go HIGH during the current clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than  $t_{SKEW1}$ , then  $\overline{FF}$  may not change state until the next WCLK rising edge.
13.  $t_{SKEW2}$  is the minimum time between a rising WCLK edge and a rising RCLK edge to guarantee that  $\overline{EF}$  will go HIGH during the current clock cycle. If the time between the rising edge of WCLK and the rising edge of RCLK is less than  $t_{SKEW2}$ , then  $\overline{EF}$  may not change state until the next RCLK rising edge.

Switching Waveforms (continued)

Figure 5. Reset Timing<sup>[14]</sup>

Notes

14. The clocks (RCLK, WCLK) can be free-running during reset.

15. After reset, the outputs will be LOW if  $\overline{OE} = 0$  and three-state if  $\overline{OE} = 1$ .

16. Holding  $\overline{WEN2/LD}$  HIGH during reset will make the pin act as a second enable pin. Holding  $\overline{WEN2/LD}$  LOW during reset will make the pin act as a load enable for the programmable flag offset registers.

Switching Waveforms (continued)

Figure 6. First Data Word Latency after Reset with Read and Write

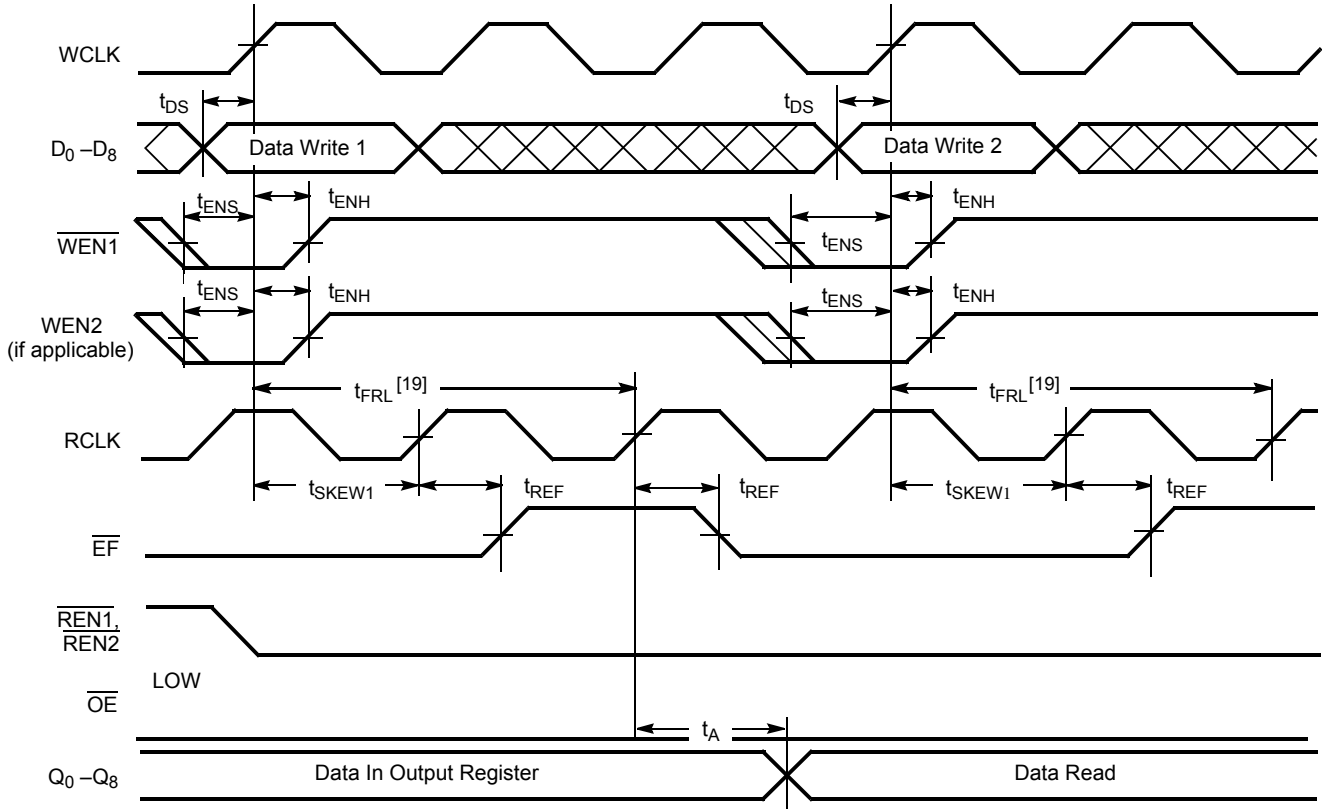

Notes

17. When  $t_{SKEW1} \geq$  minimum specification,  $t_{FRL}$  (maximum) =  $t_{CLK} + t_{SKEW2}$ . When  $t_{SKEW1} <$  minimum specification,  $t_{FRL}$  (maximum) = either  $2 * t_{CLK} + t_{SKEW1}$  or  $t_{CLK} + t_{SKEW1}$ . The Latency Timing applies only at the Empty Boundary (EF = LOW).
18. The first word is available the cycle after EF goes HIGH, always.

Switching Waveforms (continued)

Figure 7. Empty Flag Timing

Note

19. When  $t_{SKEW1} \geq$  minimum specification,  $t_{FRL}$  (maximum) =  $t_{CLK} + t_{SKEW2}$ . When  $t_{SKEW1} <$  minimum specification,  $t_{FRL}$  (maximum) = either  $2 * t_{CLK} + t_{SKEW1}$  or  $t_{CLK} + t_{SKEW1}$ . The Latency Timing applies only at the Empty Boundary ( $EF = LOW$ ).

Switching Waveforms (continued)

Figure 8. Full Flag Timing

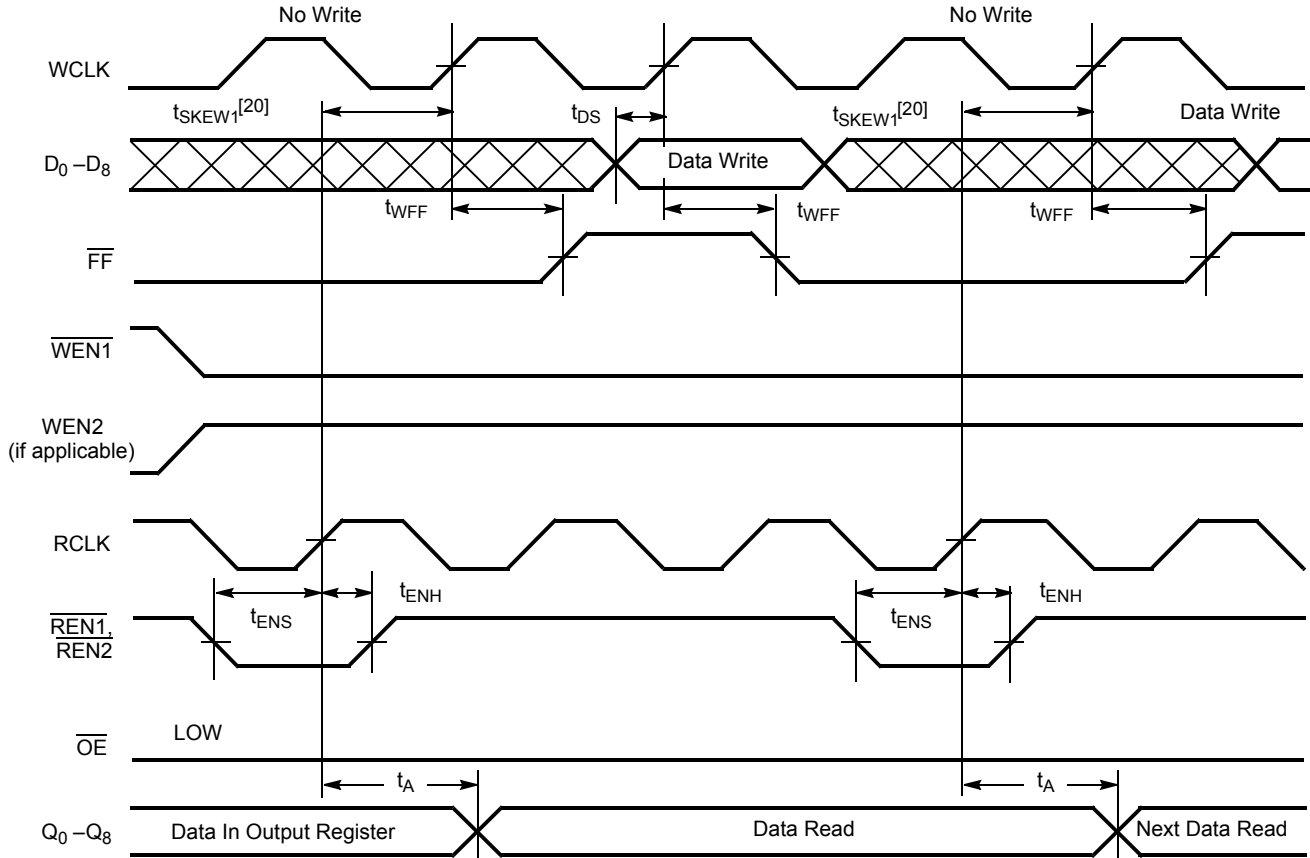

Figure 9. Programmable Almost Empty Flag Timing

Notes

20.  $t_{SKEW1}$  is the minimum time between a rising RCLK edge and a rising WCLK edge to guarantee that  $\overline{FF}$  will go HIGH during the current clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than  $t_{SKEW1}$ , then FF may not change state until the next WCLK rising edge.
21.  $t_{SKEW2}$  is the minimum time between a rising WCLK and a rising RCLK edge for PAE to change state during that clock cycle. If the time between the edge of WCLK and the rising RCLK is less than  $t_{SKEW2}$ , then PAE may not change state until the next RCLK.
22. PAE offset = n.
23. If a read is performed on this rising edge of the read clock, there will be Empty + (n-1) words in the FIFO when  $\overline{PAE}$  goes LOW.

Switching Waveforms (continued)

Figure 10. Programmable Almost Full Flag Timing

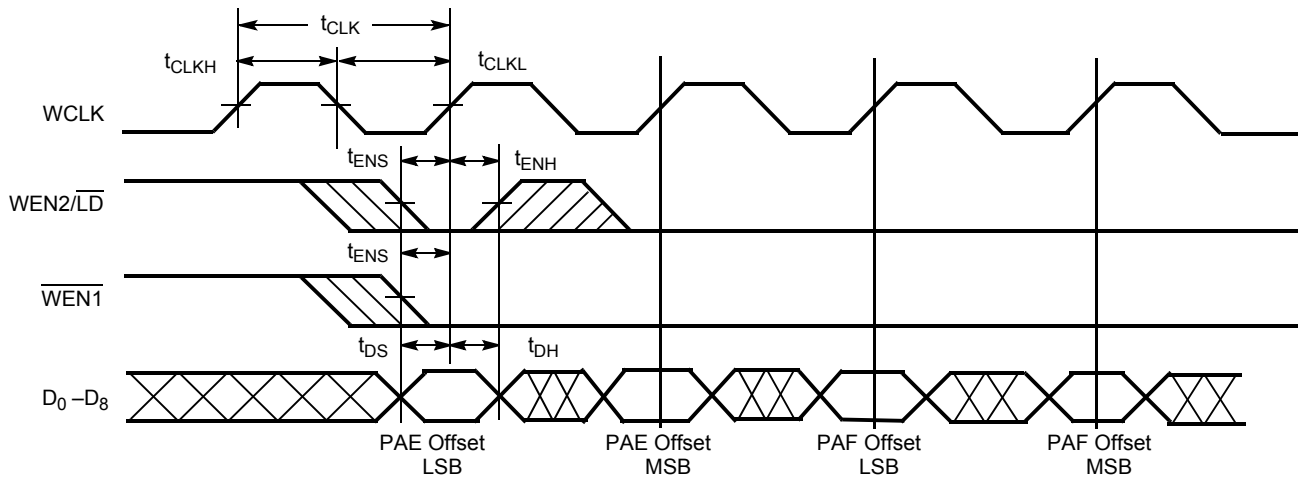

Figure 11. Write Programmable Registers

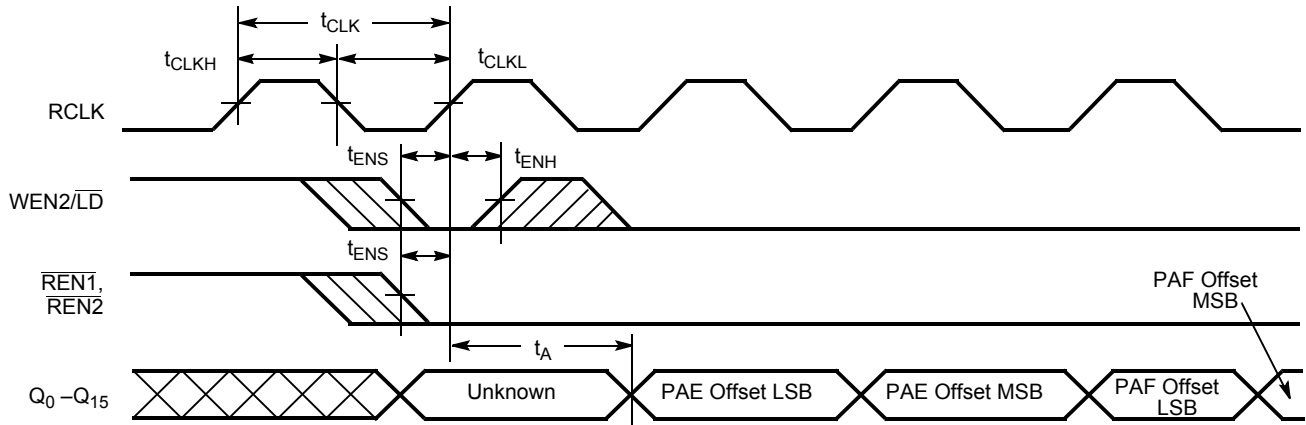

Notes

- 24. If a write is performed on this rising edge of the write clock, there will be Full - (m-1) words of the FIFO when  $\overline{\text{PAF}}$  goes LOW.
- 25. PAF offset = m.
- 26. 16 K - m words for CY7C4261V, 32 K - m words for CY7C4271V, 64 K - m words for CY7C4281V, and 128 K - m words for CY4291V.
- 27. t<sub>SKEW2</sub> is the minimum time between a rising RCLK edge and a rising WCLK edge for PAF to change during that clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than t<sub>SKEW2</sub>, then PAF may not change state until the next WCLK.

Switching Waveforms (continued)

Figure 12. Read Programmable Registers

### Ordering Information

16 K × 9 Low-Voltage Deep Sync FIFO				
Speed (ns)	Ordering Code	Package Name	Package Type	Operating Range
10	CY7C4261V-10JXC	J65	32-pin Pb-free plastic leaded chip carrier	Commercial
15	CY7C4261V-15JXC	J65	32-pin Pb-free plastic leaded chip carrier	Commercial
64 K × 9 Low-Voltage Deep Sync FIFO				
10	CY7C4281V-10JXC	J65	32-pin Pb-free plastic leaded chip carrier	Commercial
128 K × 9 Low-Voltage Deep Sync FIFO				
15	CY7C4291V-15JXC	J65	32-pin Pb-free plastic leaded chip carrier	Commercial

### Ordering Code Definitions

**Package Diagram**

**Figure 13. 32-Pin Pb-free Plastic Leaded Chip Carrier J65, 51-85002**

## Acronyms

**Table 3. Acronyms Used**

Acronym	Description
CMOS	complementary metal oxide semiconductor
$\overline{\text{CE}}$	chip enable
I/O	input/output
$\overline{\text{OE}}$	output enable
SRAM	static random access memory
TSOP	thin small outline package
$\overline{\text{WE}}$	write enable

## Document Conventions

### Units of Measure

**Table 4. Units of Measure**

Symbol	Unit of Measure
ns	nanosecond
V	volt
$\mu\text{A}$	microampere
mA	milliampere
pF	picofarad
$^{\circ}\text{C}$	degree Celsius
W	watt

## Document History Page

Document Title: CY7C4261V/CY7C4271V/CY7C4281V/CY7C4291V 16 K / 32 K / 64 K / 128 K × 9 Low-Voltage Deep Sync™ FIFOs				
Document Number: 38-06013				
Revision	ECN	Orig. of Change	Submission Date	Description of Change
**	106474	SZV	09/15/01	Changed Spec number from 38-00656 to 38-06013
*A	127858	FSG	09/04/03	Changed: $t_{SKEW2}$ to $t_{SKEW1}$ in Switching Waveforms “Empty Flag Timing” diagram Fixed flag timing diagram in Switching Waveforms section
*B	386127	ESH	See ECN	Added Pb-Free logo to top of front page Added CY7C4291V-15JXC, CY7C91V-10JXC, CY7C4281V-10JXC, CY7C4271V-10JXC, CY7C4261V-10JXC, CY7C4261V-15JXC to ordering information.
*C	2896378	RAME	03/19/2010	Removed inactive parts from Ordering information and updated package diagram.
*D	2906525	RAME	04/07/2010	Removed inactive part from Ordering Information table.
*E	3069396	ADMU	10/22/2010	Corrected data in Programmable Flag (PAE, PAF) Operation: a) PAF is synchronized to the LOW-to-HIGH transition of RCLK by one flip-flop and is LOW when the FIFO contains n or fewer unread words. Changed PAF to PAE. b) PAE is synchronized to the LOW-to-HIGH transition of WCLK by one flip-flop and is set LOW when the number of unread words in the FIFO is greater than or equal to CY7C4261 (16K-m) and CY7C4271 (32K-m). Changed PAE to PAF. Added <a href="#">Acronyms</a> , <a href="#">Document Conventions</a> , and <a href="#">Ordering Code Definitions</a> .
*F	3210221	ADMU	03/25/2011	Removed CY7C4271V-10JC part from Ordering Information table.
*G	3325014	ADMU	07/22/2011	Removed speed bin –25. Updated package diagram to *D revision.
*H	3847934	ADMU	12/20/2012	Updated <a href="#">Ordering Information</a> (Updated part numbers).

## Sales, Solutions, and Legal Information

### Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at [Cypress Locations](#).
