

## M74HC4851

# Single 8-channel analog MUX/DEMUX with injection current

#### protection Datasheet – production data

## Features

- Low power dissipation
  - $I_{CC} = 2 \ \mu A \ (max.) \ at \ T_A = 25 \ ^{\circ}C$
- Injection current protection
  - $V_{\Delta OUT}$  < 1 mV at  $V_{CC}$  = 5 V,  $I_{IN} \le$  1 mA
  - $R_S \leq 3.9 \ k\Omega$
- "ON" resistance at T<sub>A</sub> = 25 °C
  - 215  $\Omega$  typ. (V<sub>CC</sub> = 3.0 V)
  - 160 Ω typ. (V<sub>CC</sub> = 4.5 V)
  - 150  $\Omega$  typ. (V<sub>CC</sub> = 6 V)
- Fast switching
- t<sub>pd</sub> = 8.6 ns (typ.) at T<sub>A</sub> = 25 °C, V<sub>CC</sub> = 4.5 V
- Wide operating supply voltage range
  - V<sub>CC</sub> = 2 V to 6 V
- High noise immunity
  - V<sub>NIH</sub> = V<sub>NIL</sub> = 28% V<sub>CC</sub> (min.)
- Pin and function compatible with series 4051, 4851
- Latch-up performance exceeds 500 mA
   (JESD 17)
- ESD performance
  - HBM: 2000 V
  - MM: 200 V
  - CDM: 1000 V

## **Applications**

- Automotive
- Computer
- Consumer
- Industrial

## Description

The M74HC4851 device is a single 8-channel analog multiplexer/demultiplexer manufactured with silicon gate  $\rm C^2MOS$  technology.

It features injection current effect control which makes the device particularly suited for use in automotive applications where voltages in excess of normal logic voltages are common. The injection current effect control allows signals at disabled input channels to exceed the supply voltage range or go down to ground without affecting the signal of the enabled analog channel.

This eliminates the need for external dioderesistor networks typically used to keep the analog channel signals within the supply voltage range.

#### Table 1.Device summary

| Order code                      | Temperature range | Package                    | Packaging     | Marking   |
|---------------------------------|-------------------|----------------------------|---------------|-----------|
| M74HC4851YRM13TR <sup>(1)</sup> | -40/+125 °C       | SO-16 (automotive grade)   | Tape and reel | 74HC4851Y |
| M74HC4851RM13TR                 | -55/+125 °C       | SO-16                      | Tape and reel | 74HC4851  |
| M74HC4851YTTR <sup>(1)</sup>    | -40/+125 °C       | TSSOP16 (automotive grade) | Tape and reel | HC4851Y   |
| M74HC4851TTR                    | -55/+125 °C       | TSSOP16                    | Tape and reel | HC4851    |

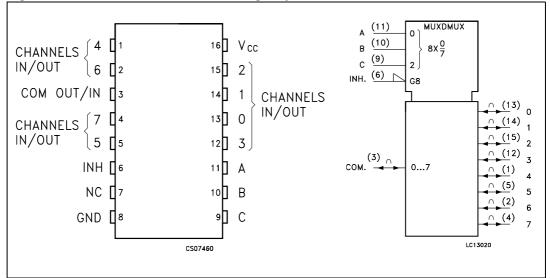

1. Qualification and characterization according to AEC Q100 and Q003 or equivalent, advanced screening according to AEC Q001 and Q002 or equivalent.

## 2 Absolute maximum ratings and operating conditions

Note: Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied.

| T <sub>op</sub>                 | Operating temperature                   | SO-16, TSSOP16 (automotive grade) | -40 to +125          | °C   |
|                                 |                                         | V <sub>CC</sub> = 2.0 V           | 0 to 1000            |      |
|                                 | Input rise and fall time <sup>(2)</sup> | V <sub>CC</sub> = 3.0.V           | 0 to 800             |      |
| t <sub>r</sub> , t <sub>f</sub> | (channel select or enable inputs        | V <sub>CC</sub> = 3.3 V           | 0 to 700             | ns   |
|                                 | only)                                   | V <sub>CC</sub> = 4.5 V           | 0 to 500             |      |
|                                 |                                         | V <sub>CC</sub> = 6.0 V           | 0 to 400             | 1    |

 For voltage drops across the switch greater than 1.2 V (switch on), excessive V<sub>CC</sub> current may be drawn; i.e., the current out of the switch may contain both V<sub>CC</sub> and switch input components. The reliability of the device is unaffected unless the maximum ratings are exceeded.

2.  $V_{\rm IN}$  from 30% to 70%  $V_{\rm CC}$  of channel selected or enable inputs.

#### Table 7.AC electrical characteristics ( $C_L = 50 \text{ pF}$ , input $t_r = t_f = 6 \text{ ns}$ ) (continued)

1.  $C_{PD}$  is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load (refer to *Figure 5*). The average operating current can be obtained by the following equation:  $I_{CC}(opr) = C_{PD} \times V_{CC} \times f_{IN} + I_{CC}/8$ .

|                   |                       | 3.3                    | l <sub>IN</sub> ≤ 10 mA, R <sub>S</sub> ≤ 20 kΩ       | 0.050                         | 20  |      |
|                   |                       |                        | $\eta_N \geq 10$ mm, $\eta_S \geq 20$ K22             | 0.024                         | 20  |      |

1. Typical values are measured at  $T_A = 25 \text{ °C}$ . They are calculated as the difference from  $V_{OUT}$  without injection current and  $V_{OUT}$  with injection current. I<sub>IN</sub> = total current injected into any other disabled channels, one at time.

#### Table 9. Test circuit 1 - switch configuration table

| Test                                | Switch          |
|-------------------------------------|-----------------|
| t <sub>PLH</sub> , t <sub>PHL</sub> | Open            |
| t <sub>PZL</sub> , t <sub>PLZ</sub> | V <sub>CC</sub> |
| t <sub>PZH</sub> , t <sub>PHZ</sub> | GND             |

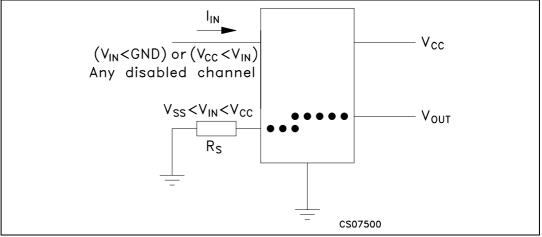

Note:

 $C_L = 50 \ pF$  or equivalent (includes jig and probe capacitance).

 $R_L = R1 = 10 \ k\Omega$  or equivalent.

 $R_T = Z_{OUT}$  of pulse generator (typically 50  $\Omega$ ).
