1 Introduction

The Teridian Semiconductor Corporation (TSC) 78M6612 Split-Phase Evaluation Board is an electrical measurement unit for performing measurements from a single electrical outlet. It incorporates the TSC 78M6612 power and energy measurement IC. The 78M6612 Split-Phase Evaluation Board is connected to a PC through a USB cable such as one provided in the demo kit package. Optionally, the 78M6612 UART TX & RX signals can be accessed via a header for communicating with an external controller or wireless communications module. The Evaluation Board demonstrates the capability of the 78M6612 energy meter controller chip for measurement accuracy and overall system use.

The board is pre-programmed with Split-Phase Demo Firmware in the flash memory of the 78M6612 IC, which allows evaluation of the IC's capabilities.

The 78M6612 Split-Phase energy measurement data and status is read back using an ASCII text string CLI command set. Easy manual operation is performed using HyperTerminal. Optionally, a Windows®-based Graphical User Interface (GUI) is provided for simplified access to the following measurement data and controls:

- Power, current, voltage and power factor indicator dials
- Line frequency
- Alarm indicators
- Programmable Alarm thresholds

1.1 Package Contents

The 78M6612 Split-Phase Evaluation Board Demo Kit includes:

- 78M6612 Split-Phase Evaluation Board
- USB Cable Assembly USB A-B 28/24 1.8M (Tyco/Amp 1487588-3)
- +12VDC@1A power supply
- CD with OMU Software and Documentation

1.2 System Requirements

The 78M6612 Split-Phase Evaluation Board requires use of a PC with the following features:

- PC (1 GHz, 1 GB) with Microsoft Windows XP® or Windows 2000, equipped with USB port.
- Minimum 1024 x 768 video display resolution.

Windows and Windows XP are registered trademarks of Microsoft Corp.

1.3 Safety and ESD Notes

EXERCISE CAUTION WHEN LIVE AC VOLTAGES ARE PRESENT!

Standard ESD precautions must be taken when handling electronic equipment. The 78M6612 contains ESD protected interfaces.

Do not connect test equipment, ICE emulators or external development boards directly to the 78M6612 Split-Phase hardware. Damage to the 78M6612 and external equipment will occur due to the 78M6612's "high side" reference topology. The 78M6612's V3P3 (i.e. "high side") is connected directly to Neutral (Earth Ground) creating a ground reference disparity with any properly grounded external equipment.

1.4 Firmware Demo Code Introduction

The Firmware Demo Code provides the following features:

- Basic energy measurement data such as Watts, Volts, current, VAR, VA, phase angle, power factor, accumulated energy, frequency, date/time, and various alarm statuses.
- Control of alarm thresholds, calibration coefficients, temperature compensation, etc.

The following setup is used to facilitate performance evaluation between the user at the PC host and the firmware code in the board:

- The Command Line Interface (CLI) via HyperTerminal or comparable terminal emulator on a different operating system. Information about the CLI is presented in Section 3.0.

The 78M6612 Split-Phase Evaluation Board is shipped with Demo Code Revision 1.14c or later loaded in the 78M6612 chip and included on the CD. The code revision can be verified by entering the command `>i` via the command line interface. Firmware for the Evaluation Board can be updated using either the Teridian TFP2 or an in-circuit emulator such as the Signum Systems ADM51 (www.signum.com).

The board components and firmware settings are designed to operate with the following nominal AC electrical ranges:

Voltage	Current	Line Frequency
110-240 VAC	10 mA – 20A	46-64 Hz

1.5 Testing the 78M6612 Split-Phase Evaluation Board Prior to Shipping

Before every 78M6612 Split-Phase Evaluation Board is shipped, the following procedures have been performed at the factory:

- Full Calibration – Precise energy source equipment is used to calibrate the current and voltage. The temperature is also calibrated at the same time.
- Accuracy Test – This "bench" level test ensures the energy accuracy is within $\pm 0.5\%$.

2 Installation

The 78M6612 Split-Phase Evaluation Board is intended for use with a 3-wire single-phase distribution system. This 3-wire single-phase distribution system is typically sourced from a distribution transformer with a single-phase input (primary) winding. The distribution transformer's secondary winding has a center tap which is defined as Neutral. Line 1 and Line 2 exist on either side of Neutral exhibiting a 180° phase shift between them.

The 78M6612 is referenced to Neutral and measures both voltages present on Line1 and Line 2 with respect to Neutral. Additionally, load currents flowing in both Line 1 and Line 2 are measured. The following figure shows the 78M6612 Split-Phase Evaluation Board's measurement inputs with various load configurations.

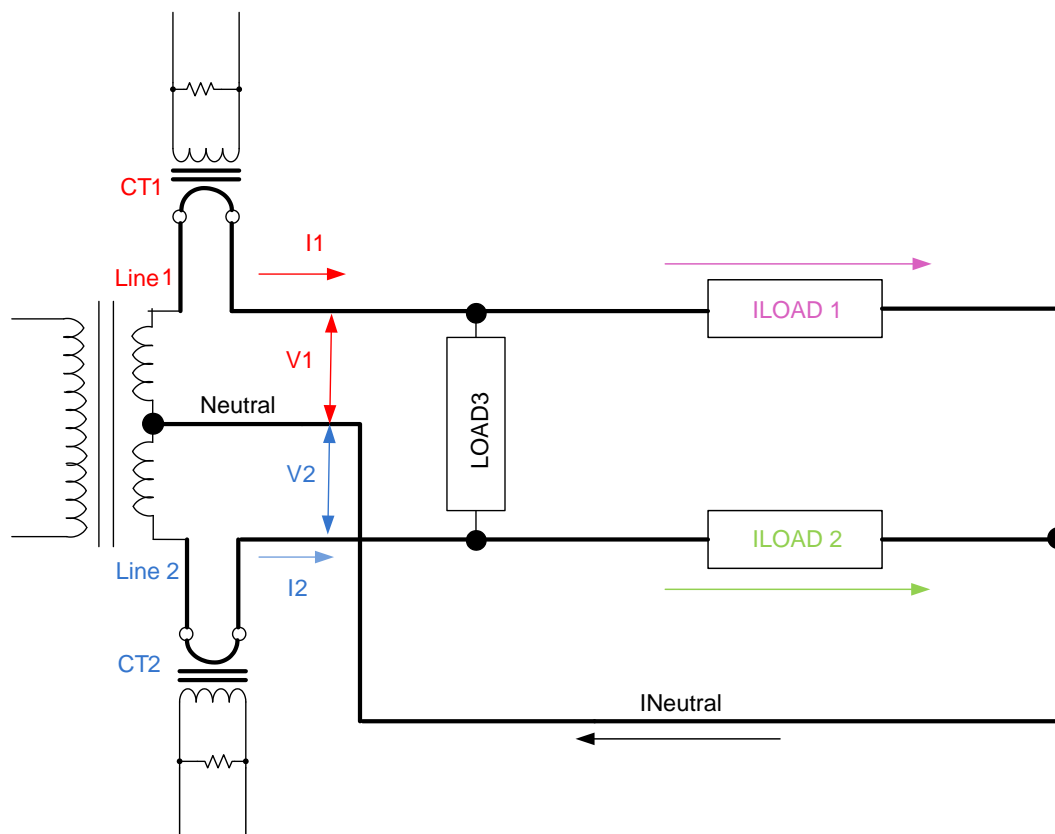

Figure 1: Split-Phase Energy Measurement Configuration

2.1 Basic Connection Setup

Figure 1 and 2 show the basic connections of the 78M6612 Split-Phase Evaluation Board for use with external equipment. The 78M6612 Split-Phase Evaluation Board is powered either by an on-board ACDC switcher or from an external +12VDC power supply. A USB cable provides the communications link between the host PC and the 78M6612 Split-Phase Evaluation Board. The high voltage AC source and load wires connect to spades mounted on the bottom side of the board.

Figure 2: Top Side 78M6612 Split-Phase Evaluation Board Connections

Install jumper J2 when using the on-board ACDC switcher. The switcher draws power from one of the AC inlet phase wires. Remove jumper J2 when attaching an external +12VDC power supply to disconnect the switcher from the AC inlet. The board draws less than 100ma from the external +12VDC supply. Use an external +12VDC power supply which is fully isolated.

Figure 3: Bottom Side 78M6612 Split-Phase Evaluation Board Connections

The high voltage AC wires attach to the spades located on the bottom side of the board. The following table describes the wiring connections.

Table 1: High Voltage AC Connections

Connector	External Circuit
J4	Neutral – from Source
J5	Neutral – to load
J7	Line 1 – from Source
J13	Line 2 - from Source
J16	Line 1 – to Load
J18	Line 2 – to Load

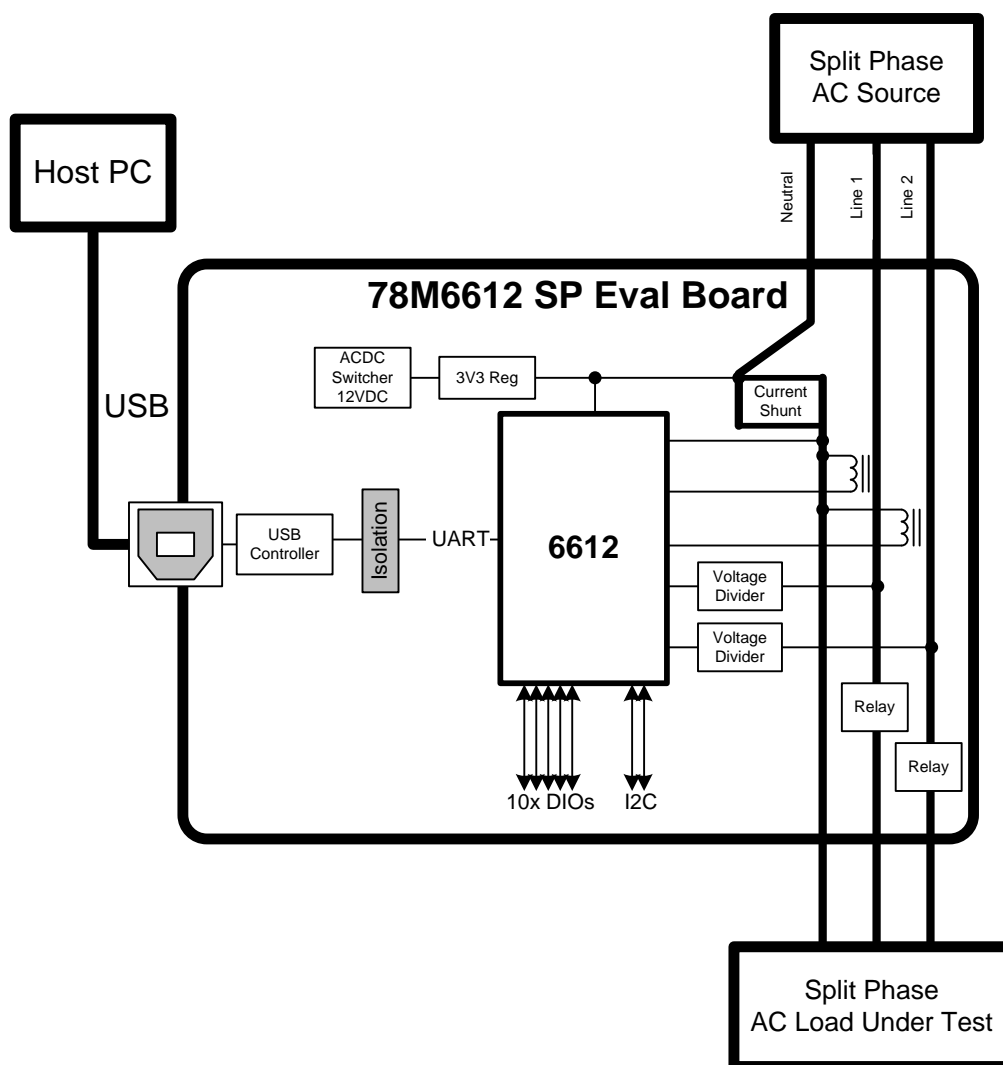

Figure 4: 78M6612 Split-Phase Evaluation Board Application Diagram

The 78M6612 Split-Phase Evaluation Board is preconfigured to measure the Load currents present on Line 1 and Line 2 using two current transformers (CT). Alternatively, the board has provisions to replace the Line 1 CT with a current sensing shunt in series with the Neutral wire. Two resistors (R18 and R43) provide the sensor selection. The following table provides the resistor population options for selecting the CT versus the shunt.

Table 2: Line 1 versus Neutral Current Sensing Configuration

Sensor Configuration	R18	R43
CT – Line 1	No Component	Install 750Ω
Shunt - Neutral	Install 750Ω	No Component

Presently the firmware only supports the CT–Line1 configuration.

2.2 Relay Configuration

The CLI commands support separate Line 1 and Line 2 relays. However, the 78M6612 Split-Phase Evaluation Board uses DIO7 to control both Line 1 and Line 2 relays so that control of power to both remains in sync.

2.3 Optional UART Interface

The 78M6612 Split-Phase Evaluation Board provides an option to bypass the on-board serial USB controller. This option is useful for communicating with an external controller or attachment of a wireless module.

The optional UART interface is accessible via connector J12. Remove the 0Ω resistor R38 to prevent TX contention with the on-board isolator's output, U3.

Figure 5: UART Connector

Due to the 78M6612's V3P3 being directly connected to Neutral, the Teridian supplied UART isolator must be inserted between the evaluation board and the external controller. The V3P3 to Neutral connection results in the 78M6612's GND pin being 3.3V below the external controller's GND pin. Additionally, the UART isolator board provides for galvanic isolation between the evaluation board and the external controller hardware.

Figure 6: UART Isolator Daughter Card

Table 3: J12 UART Connector Pin Assignments

J12 Pin Number	Identifier	Function
1	V3P3	+3.3V to daughter card
2	TXD	78M6612 TXD output
3	RXD	78M6612 RXD input
4	GND	GND to daughter card

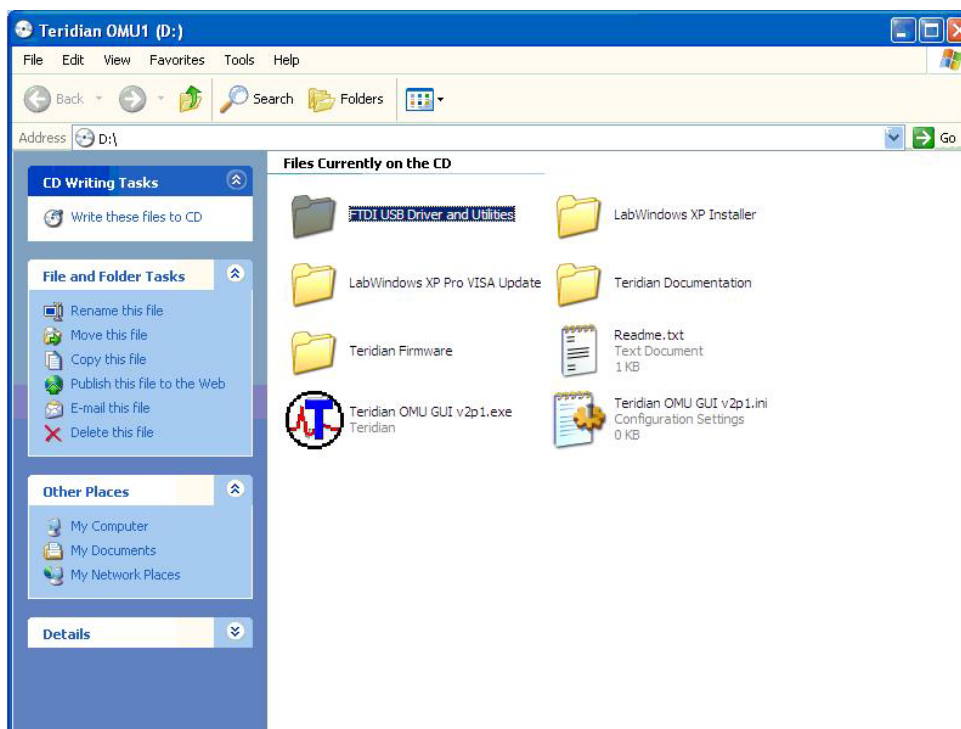

The UART Isolator daughter card maintains the same pin functions on its connector interface to the external controller.

The UART isolator board is not required when using a wireless module. However, use of an antenna with an exposed metal mounting base presents a safety hazard. The other consideration regarding use of a wireless module is the module's transmitting power consumption. The on-board switcher can provide only 100mA (at 3.3V). Use an external power supply if the transmitter's power is greater than 100mA.

2.4 USB Driver Installation

This evaluation kit includes an isolated USB interface for serial communications with a PC. The FTDI USB controller IC FT232R performs the USB functions. The FTDI Windows driver presents a virtual COM port for enabling serial communications. Control of the 78M6612 Split-Phase Evaluation Board can be managed using either a terminal emulation program or using the supplied Windows GUI. The FTDI Windows driver is a certified driver for Windows 2000 and XP.

1. Upon attaching the 78M6612 Split-Phase Evaluation Board to the PC, the Found New Hardware Wizard automatically launches and installs the appropriate driver files. If your PC does not find the FTDI driver files on its local hard disk drive, locate and reference the FTDI USB Driver and Utilities subdirectory on the CD. The FT232R controller is powered from the USB cable and is active even when no power is applied to the 78M6612 Split-Phase Evaluation Board.

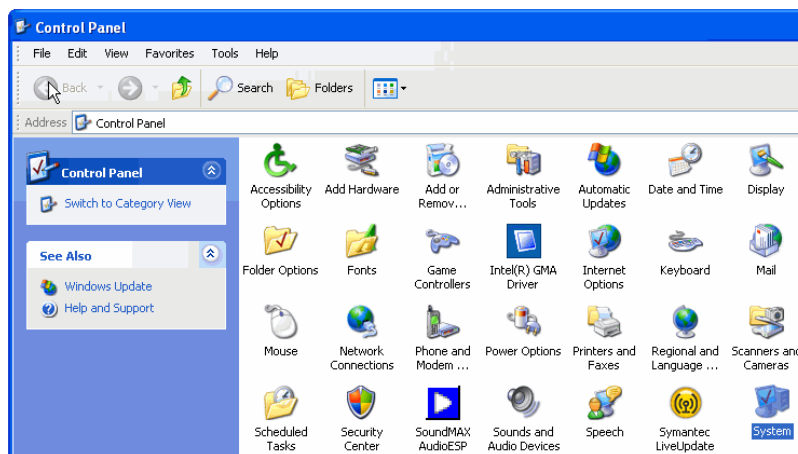

Notes: If an older FTDI driver has been previously installed, it is recommended to remove the older version before installing this newer FTDI driver. Execute the **ftdiClean.exe** utility from the FTDI USB Driver and Utilities subdirectory.

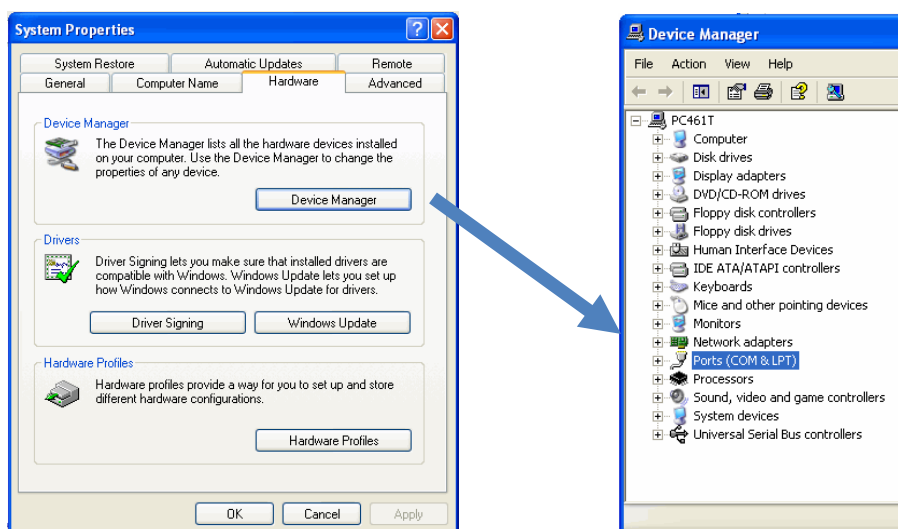

For FTDI driver support on other operating systems, please check FTDI's website at (**Error! Hyperlink reference not valid.**www.ftdichip.com/FTDrivers.htm).

2.5 Confirm COM Port Mapping

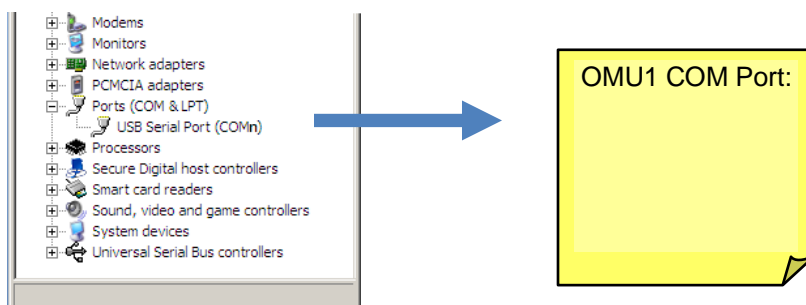

- Launch the **Control Panel** and click on the **System** icon.

- The **System Properties** screen appears. Click on the **Hardware** tab. Click on **Device Manager**. Under **Ports (COM & LPT)**, look for the **USB Serial Port** assignment.

- Take note of the COM port assignment for the USB Serial Port.

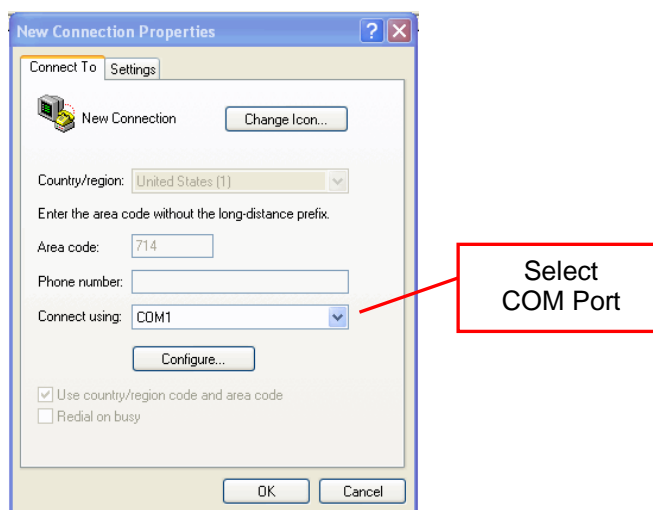

2.6 Verify Serial Connection to the PC

After connecting the USB cable from the 78M6612 Split-Phase Evaluation Board to the host PC, start the HyperTerminal application (or another suitable communication program) and create a session using the communication parameters show in Table 1.

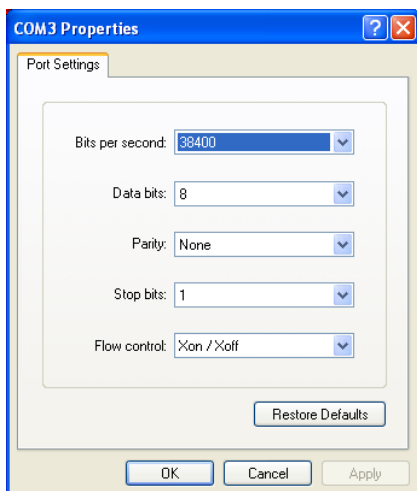

Table 4: COM Port Setup Parameters

Setup Parameter	78M6612
Port speed (baud)	38400
Data bits	8
Parity	None
Stop bits	1
Flow control	Xon/Xoff

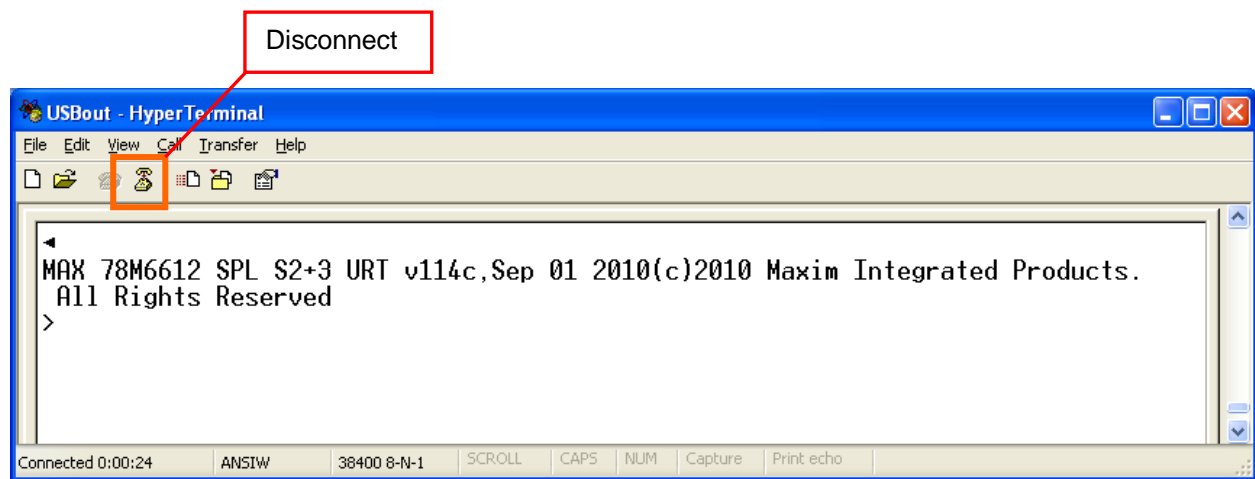

HyperTerminal can be found in Windows by selecting **Start → All Programs → Accessories → Communications → HyperTerminal**. The connection parameters are configured by selecting **File → Properties**. The **New Connection Properties** menu appears.

Select the appropriate **COM port** and click **Configure**. The **COMn Properties** menu appears.

Note that port parameters can only be adjusted when the connection is not active. It may be necessary to click the **Disconnect Button** to disconnect the port.

FTDI COM Port Trouble-Shooting

If the FTDI device driver did not install properly, there would be no assigned COM port number for the FTDI controller. Repeat the USB Driver Installation, see Section 2.3.

Microsoft Windows may associate a Ball Point device to the FTDI USB controller. When this occurs a FTDI device COM port assignment is available via HyperTerminal but there is no communications data. Verify if a Ball Point device has been added to the "Human Interface Devices" via the Device manager. Refer to Section 2.4 for access to the Device Manager. If a Ball Point device exists, delete it and unplug and replug the evaluation board's USB cable.

3 Initialization and Calibration

The 78M6613 Split-Phase Firmware includes a relay control routine that initializes the relays in the 'off' position. Until relays are turned 'on' using the TC0 command, only voltage, line frequency, and chip temperature can be measured and reported. To globally turn on or off relays with the Split-Phase Firmware, the following commands should be used.

```
>TC0 (turn on all relays)
>TC3 (turn off all relays)
```

The Split-Phase firmware also includes built in calibration routines. Using the precision source method, a known external voltage source, ambient temperature, and current source (load) is provided to the evaluation board during calibration by Teridian. The routine automatically adjusts coefficients until measured values match known (target) values and saves them to flash memory. It is recommended the user read back and record these calibration coefficients. This will allow the user to re-store the calibration settings should the firmware for the evaluation board be updated in the future. There are four calibration coefficients: one for each voltage input and one for each current input. These four coefficients are read back using the **J8????** command.

```
>J8????
+11290 +11294 +16542 +16544
>_
```

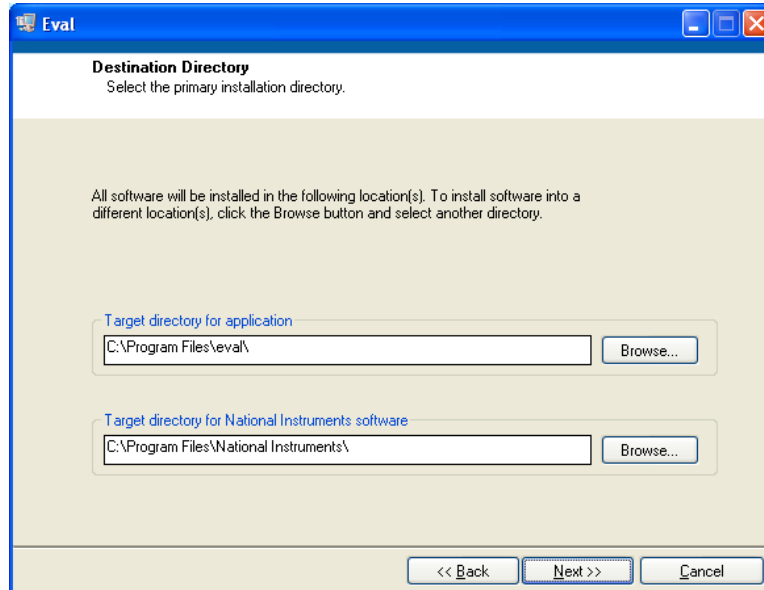

4 Windows Graphical User Interface (GUI)

The 78M6612 Split-Phase GUI displays RMS voltage and current, power, volt-amperes, and power factor for two independent phases as well as totals for these parameters. A true RMS line-to-line voltage is also shown. Indicators are provided for the various alarms.

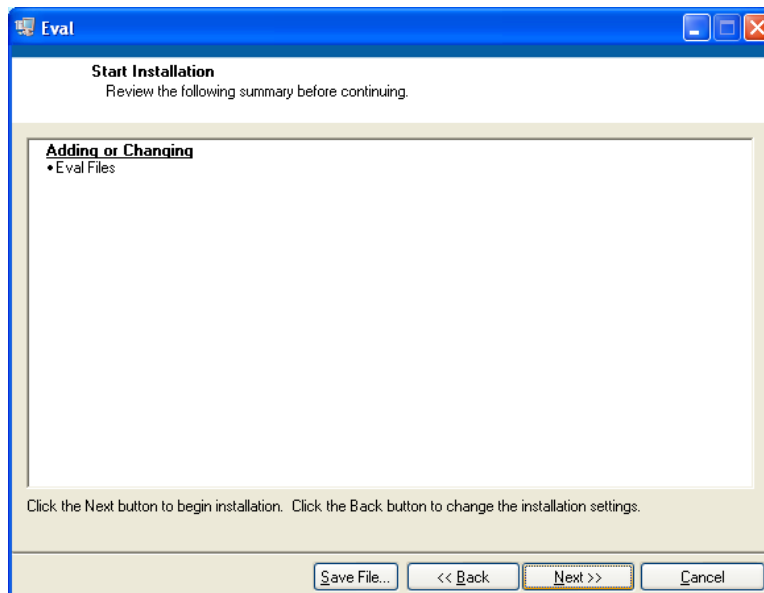

The 78M6612 Split-Phase GUI is a National Instruments CVI application program. Click on the GUI **setup.exe** file provided on the CD to start the self installer.

4.1 Installing the GUI

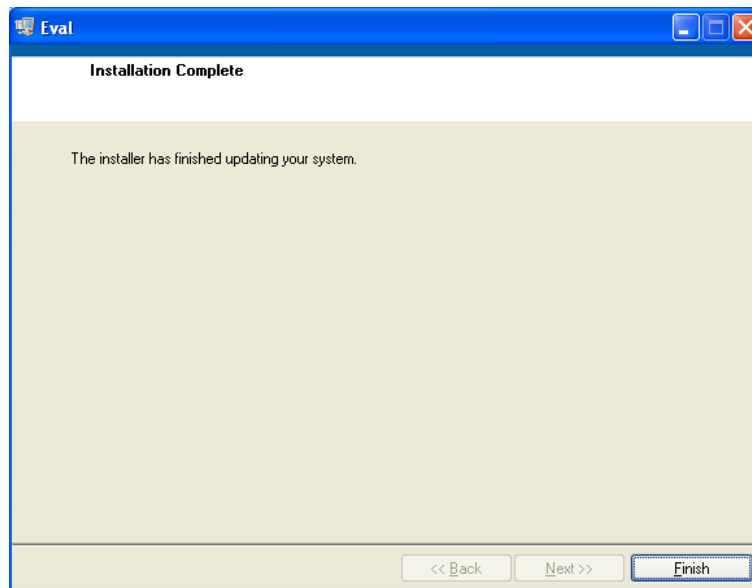

After clicking on **setup.exe**, select the installation directories and click on **Next**.

Confirm the installation and click on **Next**.

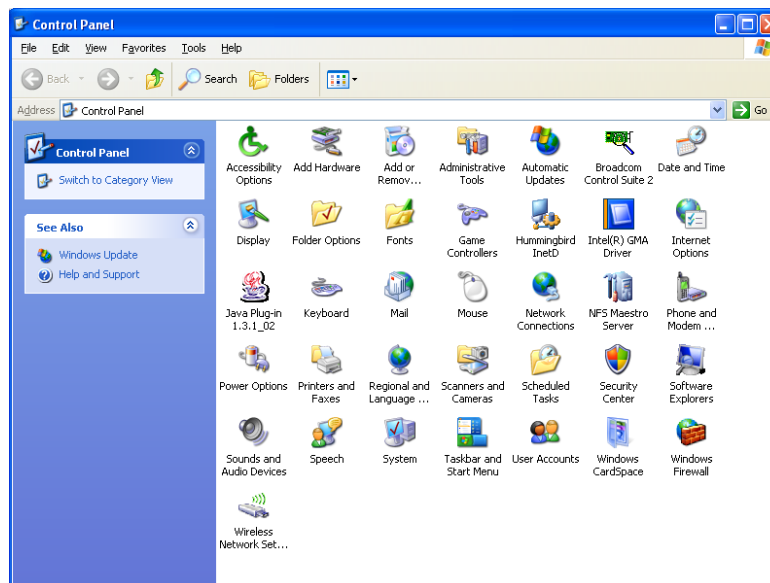

Confirm installation completion and click on **Finish**:

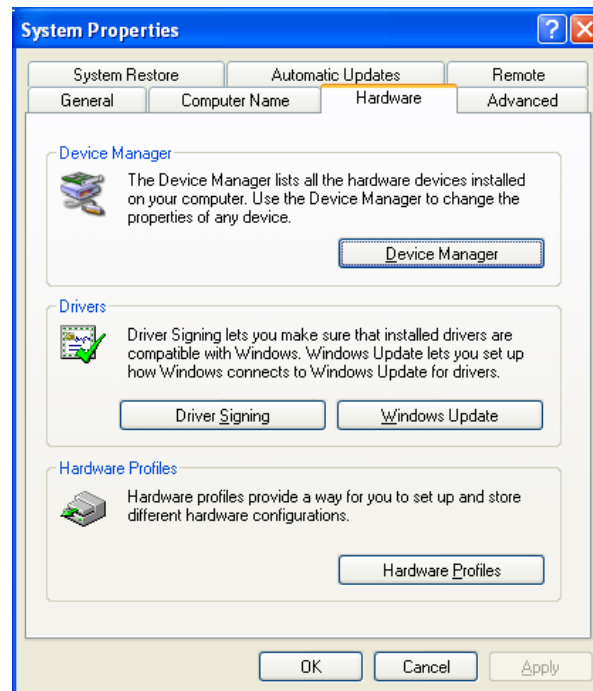

4.2 Changing the Com Port Assignment

The 78M6612 Split-Phase GUI only allows for selecting Com Port assignments of COM1 through COM4. If your FTDI device is assigned a higher Com Port number, open the Device Manager and navigate to the device's Advanced Settings properties to change the Com port number.

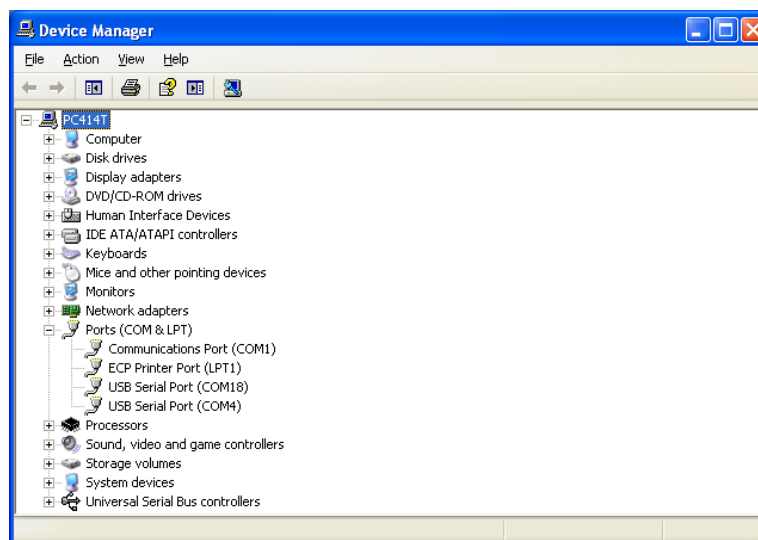

Click on the **Device Manager** icon:

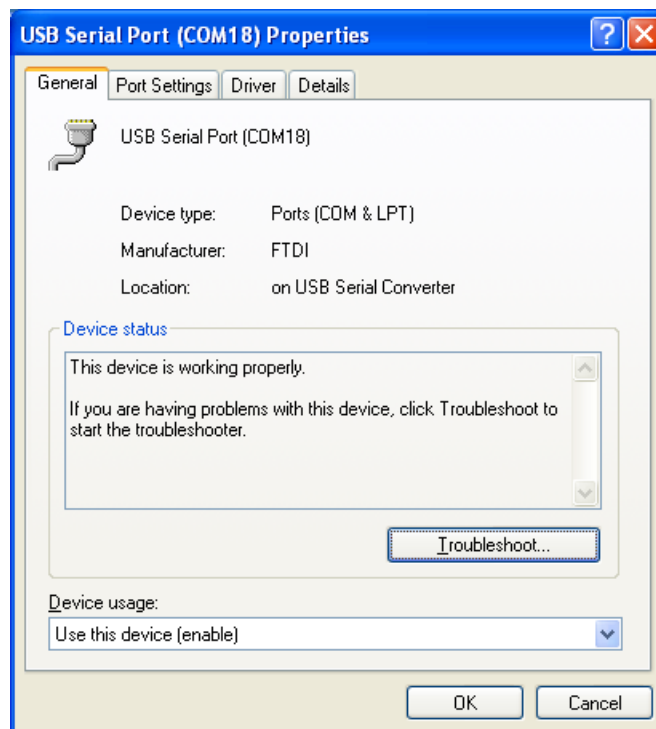

Click on the **Device Manager** button in the Hardware tab:

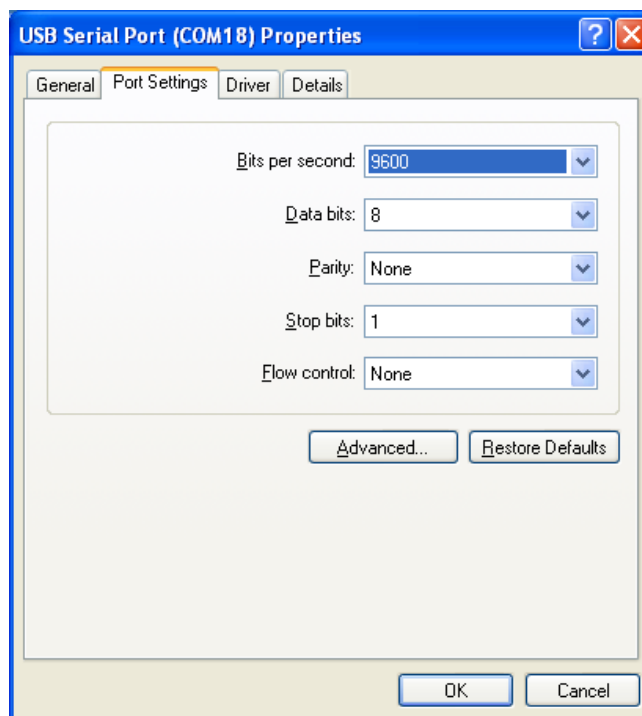

Click on the **Ports (COM & LPT)** line item to display all assigned ports. Then highlight and click **Properties** of the desired USB Serial Port:

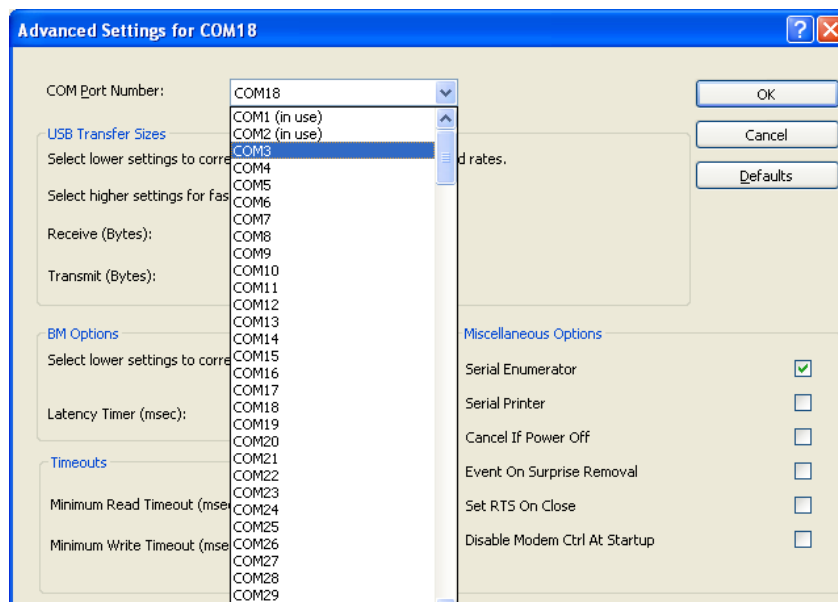

Click on the **Port Settings** tab:

Click on the **Advanced** button:

Click on the **COM Port Number drop down arrow** and select an available Com Port between 1 and 4:

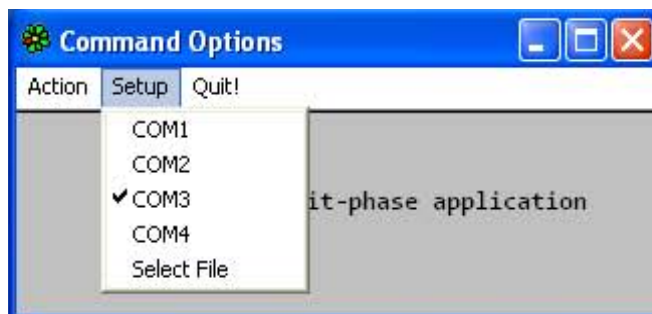

Click OK on the various screens to accept this Com Port assignment change.

4.3 Starting the GUI

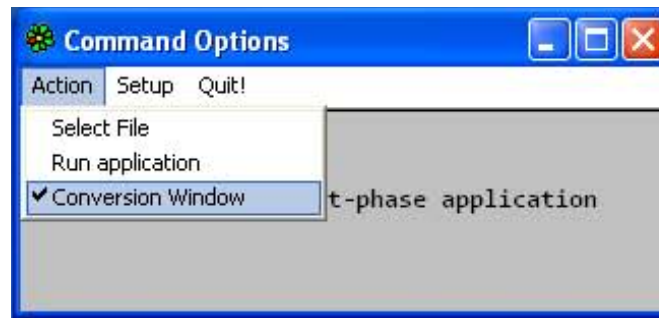

Start the 78M6612 Split-Phase GUI by clicking on the GUI's **eval.exe** file via the Start Menu or locate the executable in the target directory selected earlier.

Click on **Setup** to select the Com Port assigned to the FTDI device:

Click on **Action** to display the Measurement panel:

Click on the **Start** and **Stop** buttons to operate the GUI:

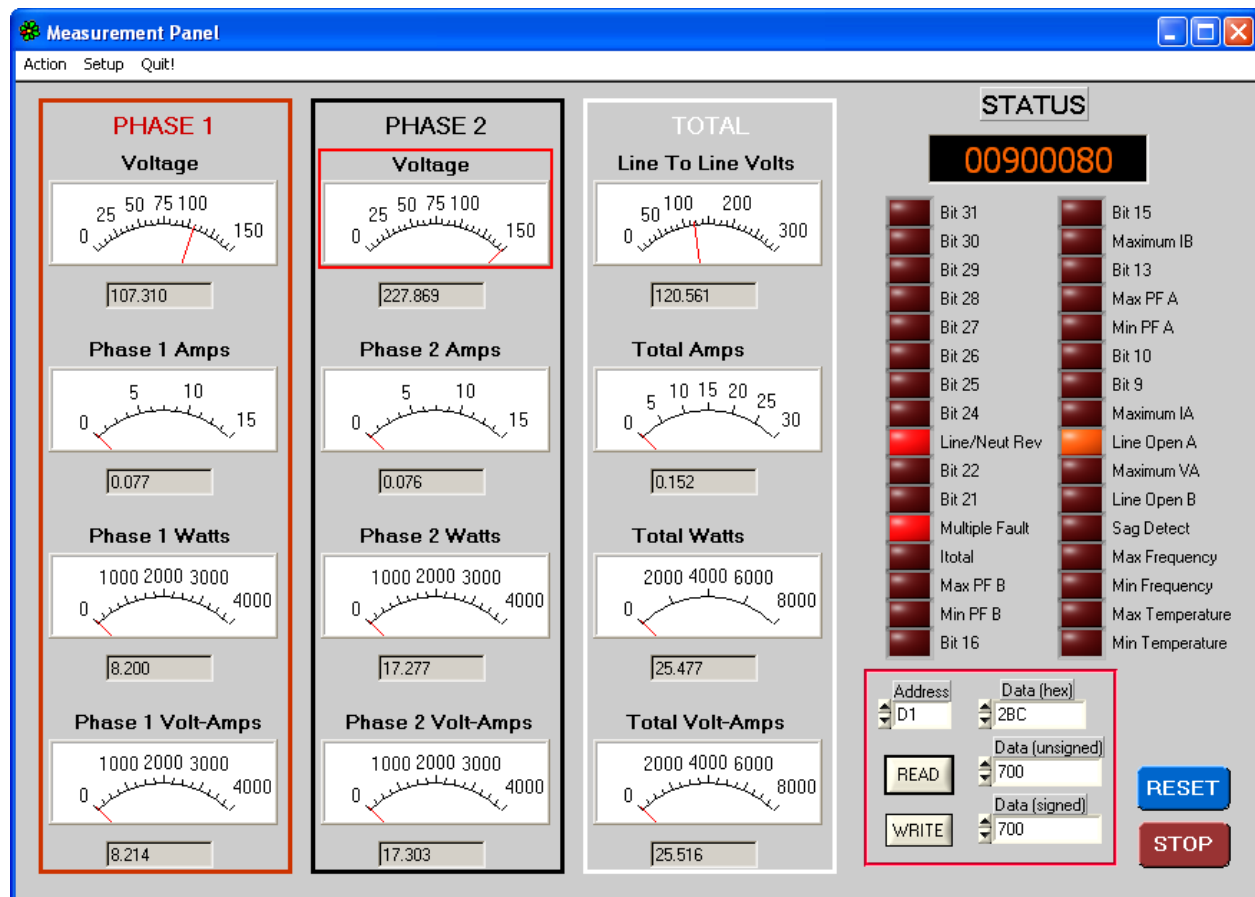

Figure 7: 78M6612 Split-Phase GUI

Write address = **F0** and data = **0** to turn on the relays.

Write address = **F0** and data = **1** to turn off the relays.

5 Schematics, Bill of Materials and PCB Layouts

This section includes the schematics, bill of materials and PCB layouts for the 78M6612 Split-Phase Evaluation Board.
