General Description

The MAX4834/MAX4835 family of low-dropout (LDO) linear regulators feature an accurate current-limiting switch with an integrated $\overline{FLAG}$ or $\overline{RESET}$ function. These devices operate from 2.5V to 5.5V and deliver up to 250mA of load current at a preset output voltage. Preset output voltage levels are 1.8V/2.5V/2.8V/3.0V/3.3V.

The MAX4834/MAX4835 offer a programmable soft-start control function to eliminate false reset during startup. The MAX4834 provides a $\overline{FLAG}$ function to notify the system when the load current exceeds the limit. The MAX4835 provides a $\overline{RESET}$ function to notify the system when the output drops below the threshold. Additionally, reverse-current protection prevents current flowing from the output to the input. Other features include a low 90µA quiescent current, a 0.1µA shutdown current.
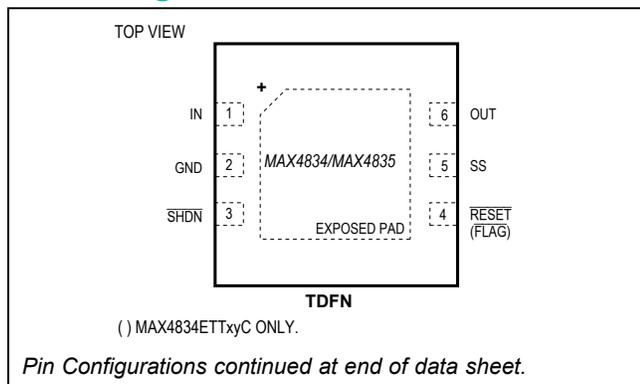

The MAX4834/MAX4835 are available in space-saving 6-pin SOT23 and TDFN packages. Each device is specified over the -40°C to +85°C extended temperature range. Contact factory for other programmed output voltage versions from 1.5V to 3.3V in 100mV increments.

For pin-compatible 100mA versions of this device, refer to the MAX4832/MAX4833. For pin-compatible 500mA versions of this device, refer to the MAX4836/MAX4837.

Applications

- SDIO Ports and Devices
- USB Ports and Devices
- PDAs and Palmtop Devices
- Notebook Computers
- Cell Phones
- GPS Systems

Features

- Guaranteed Minimum 250mA Load Current
- Accurate Current Limit
- Preset Output Voltages: 1.8V/2.5V/2.8V/3.0V/3.3V
- 2.5V to 5.5V Supply Voltage Range
- Adjustable Soft-Start
- Low Dropout Voltage
- Thermal Shutdown
- Reverse-Current Protection
- Shutdown Output Discharge (MAX4835)
- Low 90µA Supply Current
- Ultra-Low 0.1µA Shutdown Current
- $\overline{FLAG}$ and Latch Off (MAX4834) or $\overline{RESET}$ (MAX4835)
- Tiny SOT23 and TDFN (3mm x 3mm) Packages

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX4834EUTxy_+T*	-40°C to +85°C	6 SOT23
MAX4834ETTxy_+T	-40°C to +85°C	6 TDFN-EP*
MAX4835EUTxy_dd+T*	-40°C to +85°C	6 SOT23
MAX4835ETTxy_dd+T	-40°C to +85°C	6 TDFN-EP*

Note: *"xy" are placeholders for the output voltage levels of the devices. Insert the values found in Table 1 at the end of this document in the place of "xy". The "_" is a placeholder for either the $\overline{RESET}$ or the $\overline{FLAG}$ feature. Insert "B" in the place of "_" for $\overline{RESET}$ and "C" for $\overline{FLAG}$. "dd" is a placeholder for the reset timeout period. Insert the values found in Table 2 in the place of "dd." For example, MAX4835EUT18BD2 has a 1.8V output voltage, $\overline{RESET}$ feature, and a 30ms reset timeout period. Note that "dd" applies only to the devices with $\overline{RESET}$ option and does not apply to the devices with $\overline{FLAG}$ option. For devices with the $\overline{FLAG}$ option, leave dd blank. Standard versions require a minimum order increment of 2.5k units. Nonstandard versions must be ordered in 10k unit increments. Contact factory for availability.*

*Future product—contact factory for availability.
+Denotes a lead(Pb)-free/RoHS-compliant package.
*EP = Exposed pad.

THERMAL PROTECTION						
Thermal-Shutdown Temperature		Junction temperature rising		+165		°C
Thermal-Shutdown Hysteresis				15		°C

Note 1: Parts are 100% tested at +25°C. Limits across the full temperature range are guaranteed by design and correlation over the specified temperature range.

Note 2: The dropout voltage is measured from V_{IN} to V_{OUT} when V_{OUT} is 2% below its nominal value. The nominal output voltage is measured from V_{OUT} to GND when V_{IN} is 1V greater than V_{OUT}. Defined only for $V_{OUT} \geq 2.5V$.

Note 3: Soft-start time is defined as the time required for the output to rise from 10% of its nominal value to 90% of its nominal value.

**Note 4:** For $V_{OUT} < 2V$, V_{IN} must be above 2.5V.

Note 5: This is the maximum time OUT can be out of tolerance before a reset is issued. It is implemented to ensure that momentary output glitches do not trigger a reset condition.

Note 6: In startup mode, the blanking time counter is not started until the soft-start time has elapsed. The total time from startup to $\overline{FLAG}$ issued is t_{SS} + t_{BLANK}.

Pin Description

PIN		NAME	FUNCTION
SOT23	TDFN		
1	1	IN	Regulator Power Input. Bypass IN to GND with a 0.1μF ceramic capacitor. Install the bypass capacitor as close as possible to the device.
2	2	GND	Ground
3	3	$\overline{\text{SHDN}}$	Active-Low Shutdown Input. Drive $\overline{\text{SHDN}}$ low to shutdown the regulator. Drive $\overline{\text{SHDN}}$ high or connect to IN for normal operation.
4	4	$\overline{\text{FLAG}}$ (MAX4834)	Overcurrent Flag. Open-drain $\overline{\text{FLAG}}$ goes low when the device senses sustained current Exceeding the current-limit threshold for a duration longer than the blanking time. $\overline{\text{FLAG}}$ is high when $\overline{\text{SHDN}}$ is low or the device is in thermal shutdown.
		$\overline{\text{RESET}}$ (MAX4835)	Active-Low Reset Output. Push-pull $\overline{\text{RESET}}$ goes low when the voltage at OUT is below the reset threshold or when the voltage at OUT is greater than IN. $\overline{\text{RESET}}$ is low when $\overline{\text{SHDN}}$ is low or the device is in thermal shutdown. After the reset condition terminates, $\overline{\text{RESET}}$ remains low for the duration of the reset timeout period.
5	5	SS	Soft-Start Control. Connect a capacitor (C_{SS}) from SS to GND to program the output rise time at startup. No capacitor from SS to GND gives 1ms output rise time at startup. See the soft-start response time plots in the *Typical Operating Characteristics*.
6	6	OUT	Regulator Output. Bypass OUT to GND with a 3.3μF or larger ceramic capacitor. The capacitor's ESR should be less than 0.2Ω for stable operation.
—	—	EP	Exposed Pad (TDFN only). EP is internally connected to GND. Externally connect EP to GND to provide a low thermal resistance path from the IC junction to the PCB.

Detailed Description

The MAX4834/MAX4835 are ultra-low quiescent current, low-dropout linear regulators with an integrated current limiter. These devices guarantee up to 250mA drive capabilities and regulate the preset output voltage.

The MAX4834 has a flag output that asserts low when the load current exceeds the current limit for more than the blanking time (t_{BLANK}). The MAX4835 has a reset output that asserts low when the regulator output voltage is below the reset threshold voltage (V_{RESET}). V_{RESET} is 87.5% of the nominal output voltage. Figure 1 shows the simplified functional diagram and Figure 2 shows the typical application circuits.

$\overline{\text{FLAG}}$ Output (MAX4834)

The open-drain $\overline{\text{FLAG}}$ output goes low and the LDO's pass transistor is latched off when the current in the pass transistor is at its output current limit for more than the blanking time (t_{BLANK}). Cycling IN or $\overline{\text{SHDN}}$ (high to low to high) brings the device out of its latched-off state and back into normal operation.

$\overline{\text{RESET}}$ Output (MAX4835)

The $\overline{\text{RESET}}$ output asserts when one of the following conditions occurs:

- The input voltage (V_{IN}) is below the input undervoltage lockout threshold (V_{UVLO}).
- The output voltage (V_{OUT}) is below the reset threshold (V_{RESET}).
- $\overline{\text{SHDN}}$ is pulled low.
- The device is in thermal shutdown.
- When $V_{OUT} > V_{IN}$.

$\overline{\text{RESET}}$ remains low for the reset timeout period (t_{RESET}) after reset conditions are terminated. There are four $\overline{\text{RESET}}$ timeout periods available as shown in the *Electrical Characteristics* table. $\overline{\text{RESET}}$ is available in a push-pull configuration as shown in the *Selector Guide*.

Shutdown

Pull $\overline{\text{SHDN}}$ low to shut down the LDO and reduce the quiescent current consumption of the device from 90μA to 0.1μA. In shutdown mode, the pass transistor, control circuit, and reference circuit are turned off. Connect $\overline{\text{SHDN}}$ to a supply voltage greater than V_{IH} to turn on the LDO.
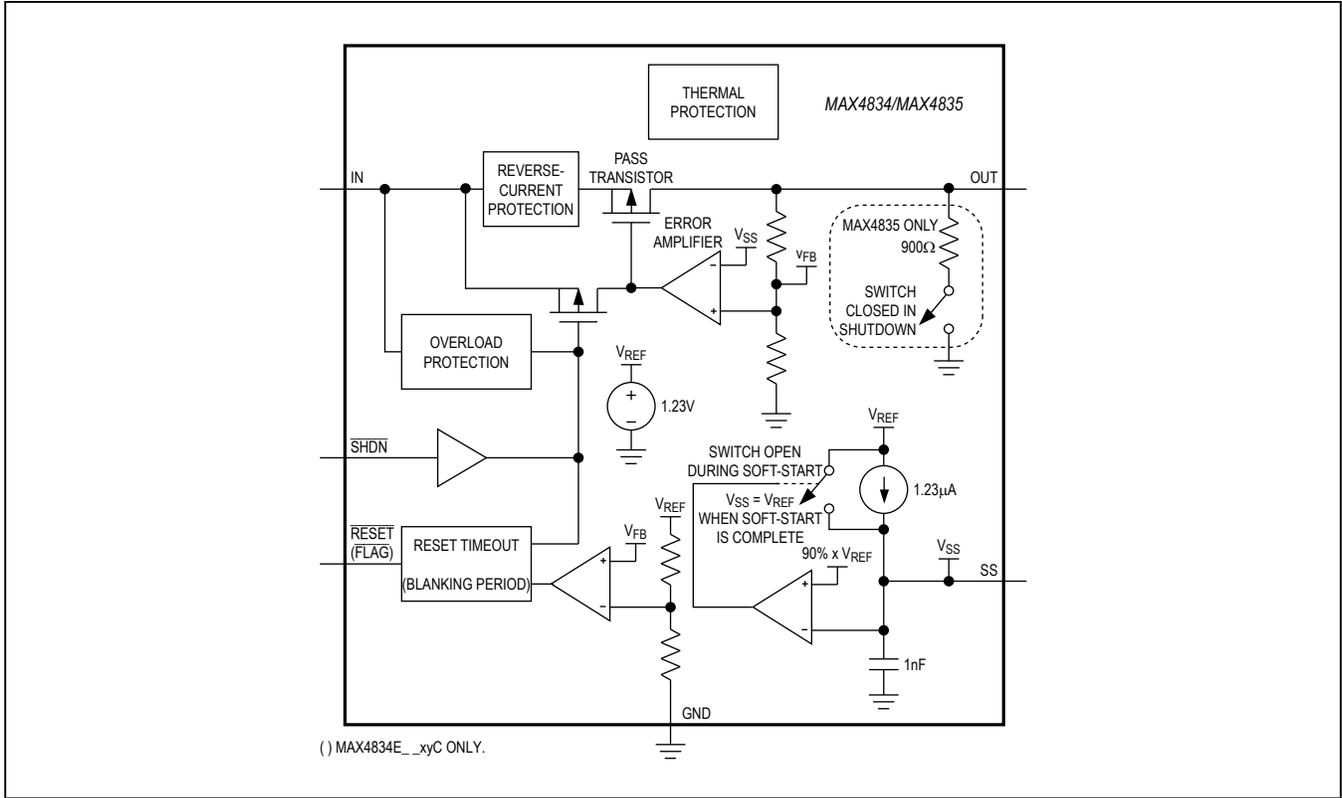

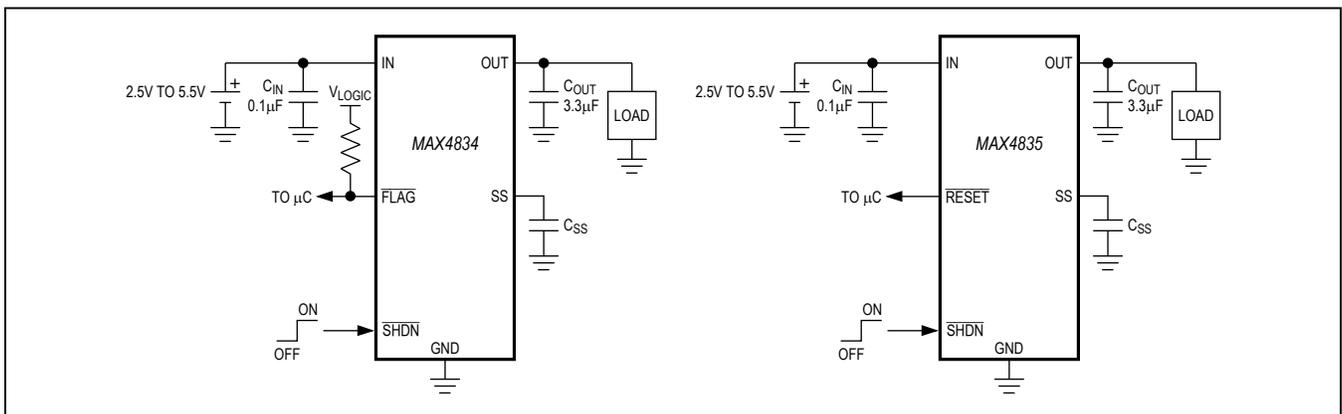

Figure 1. Functional Diagram

Figure 2. Typical Application Circuits

Shutdown Discharge (MAX4835)

OUT discharges through a 900Ω internal resistor during shutdown mode.

Reverse OUT to IN Current

When the output voltage is greater than the input voltage, the internal pass transistor turns off. To avoid reverse-charging the input source, the current at IN is guaranteed to be below 3µA when $V_{OUT} \geq V_{IN}$.

Current Limit

The MAX4834/MAX4835 include an accurate internal current-limiting circuit. OUT can be shorted to ground indefinitely without damaging the part.

The MAX4834 latches off if the load current exceeds the current limit for more than the blanking time (see the $\overline{FLAG}$ Output section). During soft-start, the device does not latch off to an overload condition. During an overload condition, the MAX4835 holds the current at current limit until the thermal limit is reached. Once the junction temperature reaches +165°C, thermal shutdown occurs.

Thermal Shutdown

When the junction temperature (T_J) exceeds +165°C, the LDO's pass transistor turns off allowing the junction to cool. The LDO's pass transistor turns on again after the IC's junction temperature cools by 15°C, resulting in a pulsed output during continuous thermal overload conditions.

Soft-Start

During power-up, the soft-start ensures that the output ramps up slowly reducing inrush current peaks. See the soft-start response time plots in the *Typical Operating Characteristic*s. The soft-start time (t_{SS}) is given by the following equation:

$$t_{SS} = C_{SS} \ (ms)$$

where C_{SS} is in nF.

A soft-start capacitor (C_{SS}) of 10nF gives a 10ms t_{SS}. A 1ms minimum soft-start time is fixed internally to ensure that the output rises slowly even without any external capacitor at SS pin to ground. The device is in soft-start mode when either the voltage at IN or $\overline{SHDN}$ is cycled high to low to high.

Applications Information

Capacitor Selection and Regulator Stability

For stable operation over the full temperature range and with load currents up to 250mA, use a 3.3µF (min) ceramic output capacitor with an ESR < 0.2Ω. To reduce noise and improve load transient response, stability, and power-supply rejection, use larger output capacitor values such as 10µF (note that some ceramic capacitors exhibit large capacitance and ESR variation with temperature). X7R capacitors provide good performance over the -40°C to +85°C operating temperature range.

To improve power-supply rejection and transient response, use a 0.1µF capacitor between IN and GND. The MAX4834/MAX4835 remain stable with purely resistive loads or current loads up to 250mA.

15kV Operational ESD Protection

A 3.3µF or higher value ceramic capacitor from OUT to GND provides a 15kV (Human Body Model) protection at OUT. The ESR value of the capacitor should be less than 0.2Ω.

Reset Transient Immunity

The reset circuit is relatively immune to short duration, falling V_{OUT} transients. The *Typical Operating Characteristics* show a graph of the Maximum Transient Duration vs. Reset Threshold Overdrive for which reset is not asserted. The graph was produced using falling V_{OUT} transients starting at V_{OUT} and ending below the reset threshold by the magnitude indicated (reset threshold overdrive). The graph shows the maximum pulse width that a falling V_{OUT} transient can typically have without triggering the reset pulse. As the amplitude of the transient increases (i.e., goes further below the reset threshold), the maximum allowable pulse width decreases. Typically, a V_{OUT} transient that goes only 10mV below the reset threshold and lasts up to 54µs does not trigger a reset pulse.

Layout

When using the TDFN package, connect its exposed pad to GND to provide a low thermal-resistance path for heat transfer from the IC junction to the PCB.

Selector Guide

PART	PIN-PACKAGE	OUTPUT CURRENT (mA)	$\overline{RESET}$ OUTPUT CONFIGURATION	$\overline{RESET}$ ($\overline{FLAG}$)	SHUTDOWN DISCHARGE	LATCH OFF
