

TPS2384 Quad Integrated Power Sourcing Equipment Power Manager

1 Features

- Quad-Port Power Management With Integrated Switches and Sense Resistors
- Compliant to IEEE 802.3af Standard
- Operates from a Single 48-V Input Supply
- Individual Port 15-bit A/D
- Auto, Semi-Auto and Power Management Operating Modes
- Controlled Current Ramps for Reduced EMI and Charging of PD's Bulk Capacitance
- I²C Clock and Oscillator Watchdog Timers
- Over-Temperature Protection
- DC and DC Modulated Disconnect
- Supports Legacy Detection for Non-Compliant PD's
- Supports AC Disconnect
- High-Speed 400-kHz I²C Interface
- Comprehensive Power Management Software Available
- Operating Temperature Range –40°C to 125°C

2 Applications

- Ethernet Enterprise Switches
- Ethernet Hubs
- SOHO Hubs
- Ethernet Mid-Spans
- PSE Injectors

4 Typical Application

3 Description

The TPS2384 is a quad-port power sourcing equipment power manager (PSEPM) and is compliant to the Power-over-Ethernet (PoE) IEEE 802.3af standard. The TPS2384 operates from a single 48-V supply and over a wide temperature range (–40°C to 125°C). The integrated output eliminates two external components per port (FET and sense resistor) and will survive 100-V transients. Four individual 15-bit A/D converters are used to measure port resistance, voltage, current and die temperature making PSE solutions simple and robust. The TPS2384 comes with a comprehensive software solution to meet the most demanding applications which can serve as a core for all PoE system designs.

The TPS2384 is available in either 64-pin PowerPAD™ down (PAP) or 64-pin PowerPAD™ up (PJD) packages.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS2384	HTQFP (64)	10.0mm x 10.0mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

5 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision D (March 2007) to Revision E	Page
• Added ESD Rating table, Thermal Information table Feature Description section, Device Functional Modes, Application and Implementation section, Power Supply Recommendations section, Layout section, Device and Documentation Support section, and Mechanical, Packaging, and Orderable Information section.....	1
• Changed text in the description of pins A1-A5 From: "connecting to chip ground" To: "connecting to digital ground"	6
• Changed the first 5 rows in the Digital I ² C DC Specifications of the Electrical Characteristics	9
• Added values for Discovery1,2 A/D conversion time in Timing Requirements TYP = 18, MAX = 22 ms	9
• Changed text in the Auto Mode From: "please contact the factory for additional application information." To: "refer to (SLUZ014)".	15
• Changed text in Start/Stop from "and not used by the TPS2384." To: (See Note ⁽¹⁾ in Table 1)	32
• Changed text in the first sentence of Chip Address	32
• Added Note ⁽¹⁾ to Table 1	33
• Changed text in Note 2 of Table 5 From: "Consult factory for Alternative B,." To: "refer to (SLUZ014) "for Alternative B,."	37
• Changed text in Note 2 of Table 7 From: "Consult factory for Alternative B,." To: "refer to (SLUZ014) "for Alternative B,."	38
• Changed the connections to pins 50 and 51 in Figure 38	44

(1) TPS2384 will acknowledge four slave address values for each setting of A5-A1 (A7,A6 = 00, 01, 10, 11). Slave devices sharing the bus with TPS2384(s) should use unique A5-A1 values not matching those of the TPS2384(s).

6 Pin Configuration and Functions

- (1) NIC = No internal connection. Pins are floating.
- (2) NIC pins can be tied to the ground plane for improved thermal characteristics and to prevent noise injection from unused pins.
- (3) NIC pins next to CINT pins should be tied to ground to prevent noise injection into A/D converter.

- (4) NIC = No internal connection. Pins are floating.
- (5) NIC pins can be tied to the ground plane for improved thermal characteristics and to prevent noise injection from unused pins.
- (6) NIC pins next to CINT pins should be tied to ground to prevent noise injection into A/D converter.

Pin Functions

PIN			I/O	DESCRIPTION
NAME	NO.			
	PAP	PDJ		
Power and Ground				
V48	60	5	I	48-V input to the device. This supply can have a range of 44 to 57 V. This pin should be decoupled with a 0.1-μF capacitor from V48 to AG1 placed as close to the device as possible.
V10	58	7	O	10-V analog supply. The 10-V reference is generated internally and connects to the main internal analog power bus. A 0.1-μF de-coupling capacitor should terminate as close to this node and the AG1 pin as possible. Do not use for an external supply.
V6.3	59	6	O	6.3-V analog supply. A 0.1-μF de-coupling capacitor should terminate as close to this pin and the AG1 pin as possible. Do not use for an external supply.
V3.3	24	41	O	3.3-V logic supply. The 3.3-V supply is generated internally and connects to the internal logic power bus. A 0.1-μF de-coupling capacitor should terminate as close to this node and the DG pin as possible. This output can be used as a low current supply to external logic.
V2.5	54	11	O	2.5-V reference supply. The V2.5 is generated internally and connects to the internal reference power bus. This pin should not be tied to any external supplies. A 0.1-μF de-coupling capacitor should terminate as close to this node and the RG pin as possible. Do not use for an external supply.
AG1	57	8	GND	Analog ground 1. This is the analog ground of the V6.3, V10 and V48 power systems. It should be externally tied to the common copper 48-V return plane. This pin should carry the low side of three de-coupling capacitors tied to V48, V10 and V6.3.
AG2	61	4	GND	Analog ground 2. This is the analog ground which ties to the substrate and ESD structures of the device. It should be externally tied to the common copper 48-V return plane. AG1 and AG2 must be tied together directly for the best noise immunity.
DG	23	42	GND	Digital ground. This pin connects to the internal logic ground bus. It should be externally tied to the common copper 48-V return plane.
RG	56	9	GND	Reference ground. This is a precision sense of the external ground plane. The integration capacitor (CINT) and the biasing resistor (RBIAS pin) should be tied to this ground. This ground should also be used to form a printed wiring board ground guard ring around the active node of the integration capacitor (CINT). It should tie to common copper 48-V return plane.
Port Analog Signal				
P1	7	58	I	Port Positive. 48-V load sense pin. Terminal voltage is monitored and controlled differentially with respect to each Port N pin. Optionally, if the application warrants, this high-side path can be protected with the use of a self-resetting poly fuse.
P2	10	55	I	
P3	39	26	I	
P4	42	23	I	
N1	6	59	I	Port negative. 48-V load return pin. The low side of the load is switched and protected by internal circuitry that limits the current.
N2	11	54	I	
N3	38	27	I	
N4	43	22	I	
RET1	5	60	I	48 V return pin.
RET2	12	53	I	
RET3	37	28	I	
RET4	44	21	I	
CINT1	4	61	I	Integration capacitor This capacitor is used for the ramp A/D converter signal integration. Connect A 0.027- μF capacitor from this pin to RG. To minimize errors use a polycarbonate, poly-polypropylene, polystyrene or teflon capacitor type to prevent leakage. Other types of capacitors can be used with increased conversion error.
CINT2	13	52	I	
CINT3	36	29	I	
CINT4	45	20	I	

Pin Functions (continued)

PIN		I/O	DESCRIPTION	
NAME	NO.			
	PAP			PDJ
Analog Signals				
CT	53	12	I	<p>This is a dual-purpose pin. When tied to an external capacitor this pin sets the internal clock. When the CT pin is grounded the SYN pin turns from a output to an input (see SYN pin description).</p> <p>The timing capacitor and the resistor on the RBIAS pin sets the internal clock frequency of the device. This internal clock is used for the internal state machine, integrating A/D counters, POR time out, faults and delay timers of each port. Using a 220-pF capacitor for CT and a 124-kΩ resistor for RBIAS sets the internal clock to 245 kHz and ensure IEEE 802.3af compliance along with maximizing the rejection of 60-Hz line frequency noise from A/D measurements.</p>
RBIAS	55	10	I	<p>Bias set resistor. This resistor sets all precision bias currents within the chip. This pin will regulate to 1.25V (V2.5/2) when a resistor is connected between RBIAS and RG. This voltage and RBIAS generate a current which is replicated and used throughout the chip. This resistor also works in conjunction with the capacitors on CT and CINT to set internal timing values. The RBIAS resistor should be connected RG. RBIAS is a high impedance input and care needs to be taken to avoid signal injection from the SYN pin or I²C signals.</p>
SYN	52	13	I/O	<p>This is a dual purpose pin. When the CT pin is connected to a timing capacitor this output pin is a 0 V to 3.3V pulse of the internal clock which can be used to drive other TPS2384 SYN pins for elimination of a timing capacitor. When the CT pin is grounded this pin becomes an input pin that can be driven from a master TPS2384 or any other clock generator signal.</p>
AC_LO	51	14	O	Totem-pole output pin for AC Disconnect excitation.
AC_HI	50	15	O	Totem-pole output pin for AC Disconnect excitation.
Digital Signals				
SCL	25	40	I	Serial clock input pin for the I ² C interface.
SDA_I	26	39	I	Serial data input pin for the I ² C interface. When tied to the SDA_O pin, this connection becomes the standard bi-directional serial data line (SDA)
SDA_O	27	38	O	Serial data open drain output for the I ² C interface. When tied to the SDA_I pin, this connection becomes the standard bi-directional serial data line (SDA). This is a open drain output that can directly drive opto-coupler.
WD_DIS	22	43	I	The WD_DIS pin disables the watchdog timer function when connected to 3.3 V. The pin has internal 50-kΩ resistor to digital ground. The watchdog timer monitors the I ² C clock pin (SCL) and the internal oscillator activity in power management mode and only the internal oscillator activity in auto mode.
INTB	20	45	O	This is an open-drain output that goes low if a fault condition occurs on any of the 4 ports.
ALTA/B	21	44	I	When this input is set to logic low there is no back-off time after a discovery failure. When this pin set to a logic high there is a back-off time (approximately 2 seconds) before initiating another discovery cycle. This pin has an internal 50-kΩ resistor pull-down to digital ground.
A1	28	37	I	Address 1 through 5 These are the I ² C address select inputs. Select the appropriate binary address on these pins by connecting to digital ground for a logic low or tying to the V3.3 pin for a logic high. Each address line has an internal current source pull-down to digital ground.
A2	29	36	I	
A3	30	35	I	
A4	31	34	I	
A5	32	33	I	
MS	63	2	I	<p>The MS pin selects either the auto mode (MS low) or the power management mode, PMM, (MS high). This pin can be held low for controller-less standalone applications. When MS is low and the POR timing cycle is complete the chip will sequentially <i>Discover</i>, <i>Classify and Power on</i> each port. When MS is set high the ports are controlled by register setting via the I²C bus. The MS pin has an internal 50-kΩ resistor pull-down to analog ground.</p>
PORB	62	3	I	<p>This pin can be used to override the internal POR. When held low, the I²C interface, all the state machines, and registers are held in reset. When all internal and external supplies are within specification, and this pin is set to a logic high level, the POR delay will begin. The I²C interface and registers will become active within 70 μs of this event and communications to read or preset registers can begin. The reset delay for the remainder of the chip then extinguishes in 1 second. This pin has an internal 50-kΩ resistor pull-down to analog ground.</p>

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾ ⁽²⁾

	MIN	MAX	UNIT
V _{I0} current sourced	100	100	μA
V _{3.3} current sourced	5	5	mA
Applied voltage on CINT#, CT, RBIAS	–0.5 to 10	10	V
Applied voltage on SCL_I, SDA_I, SDA_O, INTB, A1, A2, A3, A4, A5, MS, PORB, WD_DIS, ALT_A/B, AC_LO, AC_HI	–0.5	6	
Applied voltage on V48, P#, N#	–0.5	80	
T _J Junction operating temperature	–40	125	°C
T _{stg} Storage temperature –55 to 150	–55	150	

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to GND. Currents are positive into, negative out of the specified terminal.

7.2 ESD Ratings

	VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1500
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±100

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

	MIN	TYP	MAX	UNIT
V _{DD} Input voltage, V48	44	48	57	V
T _J Junction temperature	–40		125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		PAP [HTQFP]	PJD [HTQFP]	UNIT
		64 PINS	64 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	23.9	30.1 ⁽²⁾	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	8.4	0.3	
R _{θJB}	Junction-to-board thermal resistance	6.9	7.4	
Ψ _{JT}	Junction-to-top characterization parameter	0.2	0.2	
Ψ _{JB}	Junction-to-board characterization parameter	6.8	7.4	
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	0.2	N/A	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).
- (2) R_{θJA} will vary with the heat sink used. Data modeled using 15 mm x 15 mm x 5 mm copper block heat sink.

7.5 Electrical Characteristics

V48 = 48 V, R_T = 124 kΩ, C_T = 220 pF, C_{INT} = 0.027 μF (low leakage), –40°C to 125°C and T_A = T_J (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Power Supply					
V48 quiescent current	Off mode (all ports)	4	9	12	mA
V48 quiescent current	Powered mode (all ports)		10	14	
V _{I0} , internal analog supply	I _{LOAD} = 0	9.75	10.5	11.5	V
V _{3.3} , internal digital supply	I _{LOAD} = 0 to 3 mA	3	3.3	3.7	
V _{3.3} short circuit current	V = 0	3		12	mA

Electrical Characteristics (continued)

V48 = 48 V, $R_T = 124\text{ k}\Omega$, $C_T = 220\text{ pF}$, $C_{INT} = 0.027\text{ }\mu\text{F}$ (low leakage), -40°C to 125°C and $T_A = T_J$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V6.3, internal supply	I _{LOAD} = 0	5	6.3	7	V
V2.5, internal reference supply	I _{LOAD} = 0	2.46	2.5	2.54	
Input UVLO			26	32	
Internal POR time out(I ² C)	After all supplies are good I ² C activity is valid		8		Clock Pulses
Internal POR time out (Port)	After all supplies are good Port active to I ² C commands		66000		
Port Discovery					
Port off #P to #N input resistance		400	600		kΩ
Discovery open circuit voltage			22	30	V
Discovery 1 voltage loop control	70 μA < I _{PORT} < 3 mA	2.8	4.4		
Discovery 2 voltage loop control	70 μA < I _{PORT} < 3 mA		8.8	10

8 Parameter Measurement Information

9 Detailed Description

9.1 Overview

The TPS2384 has three internal supply buses (10 V, 6.3 V and 3.3 V) generated from the 48-V input supply. These supplies are used to bias all internal digital and analog circuitry. Each supply has been brought out separately for proper bypassing to insure high performance. The digital supply (3.3 V) is available for powering external loads up to 2 mA. For more demanding loads it is highly recommended to use external buffers to prevent system degradation. When the TPS2384 is initially powered up an internal Power-on-Reset (POR) circuit resets all registers and sets all ports to the off state to ensure that the device is powered up in a known safe operating state.

The TPS2384 has three modes of operation; automode (AM), semi-automode (SAM) and power management mode (PMM).

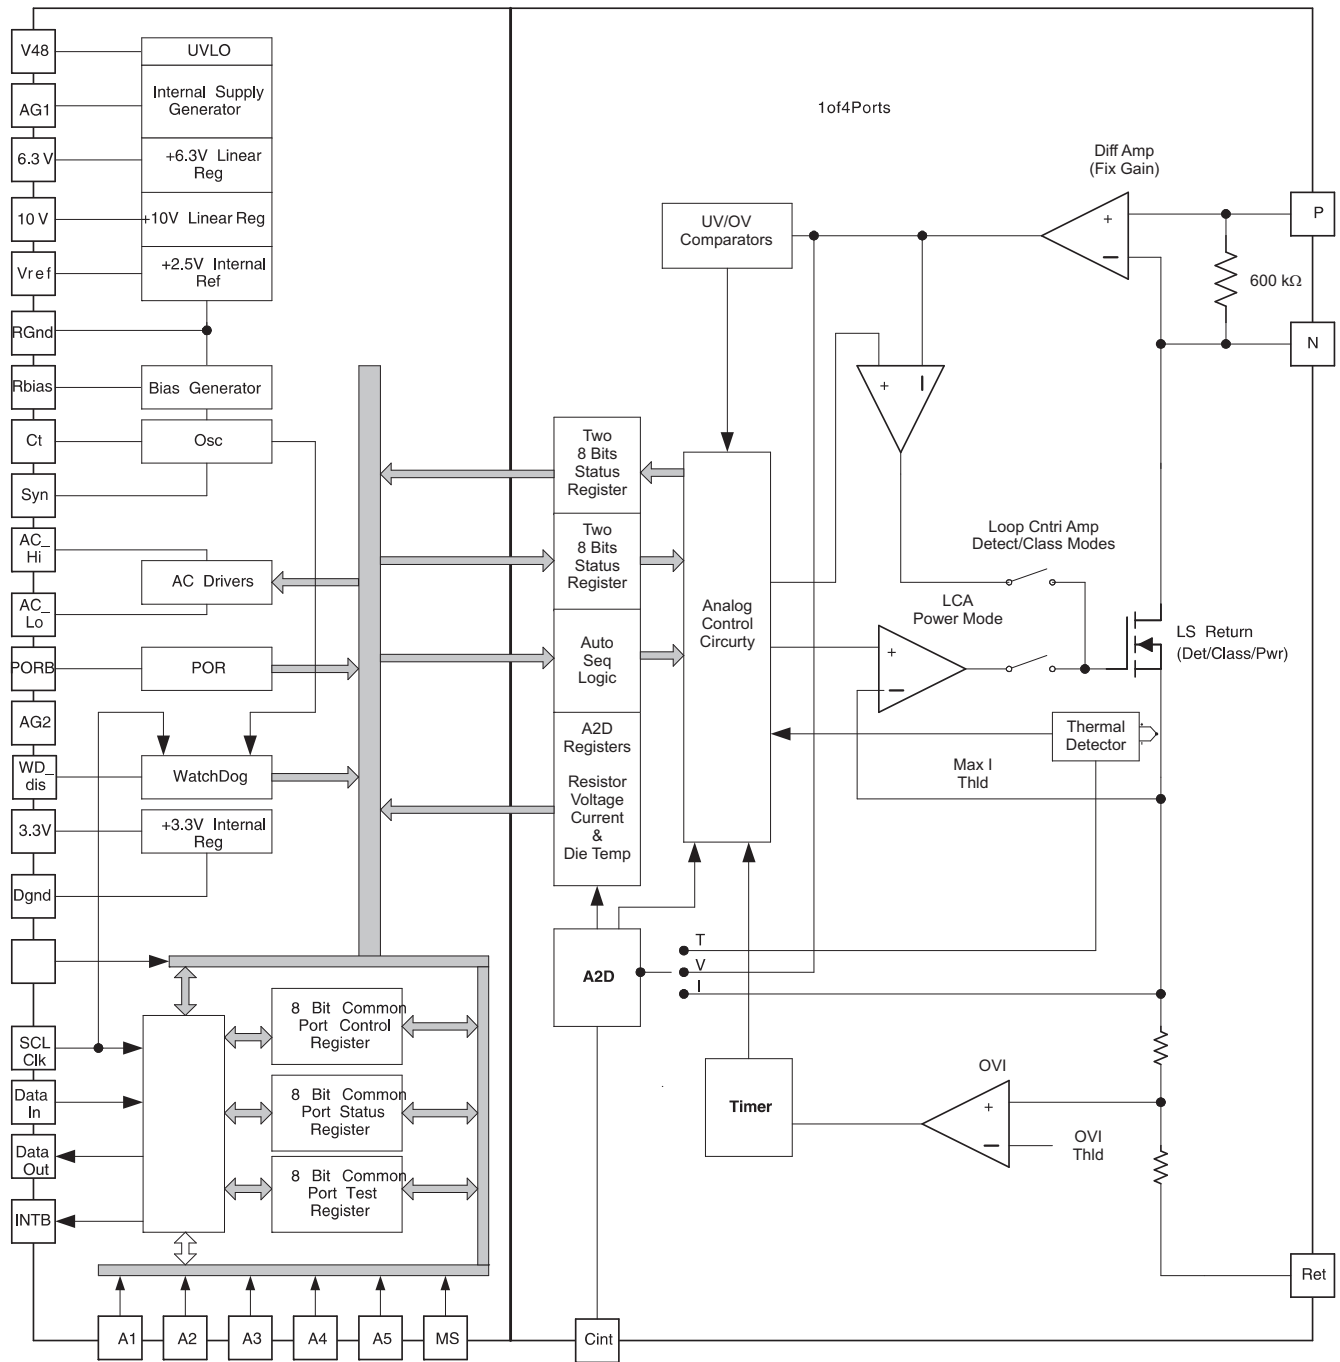

- In auto mode the TPS2384 performs discovery, classification and delivery of power autonomously to a compliant PD without the need of a micro-controller.
- In semi-automode the TPS2384 operates in automode but users can access the contents of all read status registers and A/D registers through the I²C serial interface. All write control registers are active except for D0 through D3 of Port Control register 1 (Address 0010) for limited port control. The semi-auto mode allows the TPS2384 to detect valid PD's without micro-controller intervention but adds a flexibility to perform power management activities.
- Power management mode (with a micro-controller) allows users additional capabilities of discovering non-compliant (legacy) PDs, performing AC Disconnect and advanced power management system control that are based on real time port voltages and currents. All functions in this mode are programmed and controlled through read/write registers over the I²C interface. This allows users complete freedom in detecting and powering devices. A comprehensive software package is available that mates the power of the TPS2384 with the MSP430 micro-controller.

TPS2384 integrated output stage provides port power and low-side control. The internal low-side circuitry is designed with internal current sensing so there are no external resistors required. The output design ensures the power switches operate in the fully enhanced mode for low power dissipation.

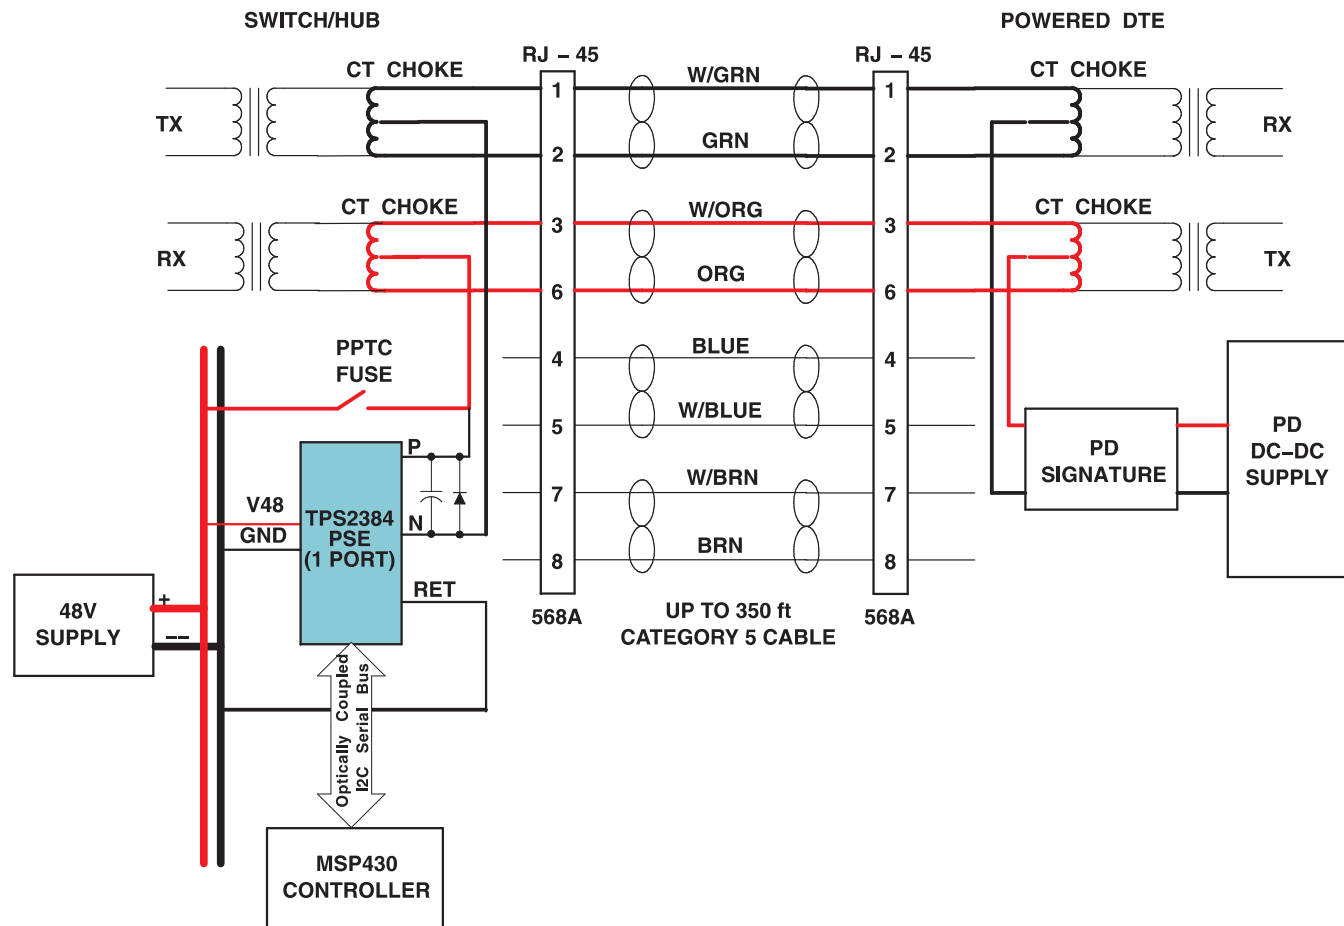

The I²C interface allows easy application of opto-coupler circuitry to maintain Ethernet port isolation when a ground based micro-controller is required. The TPS2384 five address pins (A1–A5) allow the device to be addressed at one of 31 possible I²C addresses. Per-port write registers separately control each port state (discovery, classification, legacy, power up, etc) while the read registers contain status information of the entire process along with parametric values of discovery, classification, and real-time port operating current, voltage and die temperature.

The proprietary 15-bit integrating A/D converter is designed to meet the harsh environment where the PSEPM resides. The converter is set for maximum rejection of power line noise allowing it to make accurate measurements of line currents during discovery, classification and power delivery for reliable power management decisions.

9.2 Single Port Block Diagram

9.3 System Block Diagram

NOTE: A fuse may be required to provide additional protection if isolation is lost or the low-side current sense fails.

9.4 Feature Description

9.4.1 PMM Faults

PMM faults are the same as those shown in the [AM Faults and INTB Output](#) section. In PM mode, the port under- and overvoltage and under-current faults can be disabled by writing to the control bits in the appropriate register. Monitoring for these fault conditions is enabled by default after device POR or other reset operation. The enable state of these features can be toggled by writing to the corresponding control bit as defined below and in [Table 4](#) and [Table 5](#).

The PMM faults are:

- Port under- and over-voltage faults (disable via Common Control register 0001b, bit D2)
- Overcurrent fault (cannot be disabled)
- Under-current (DC Disconnect) fault (disable via Port Control register 0010b, bit D4)
- Thermal shutdown (TSD) fault (cannot be disabled)
- Watchdog fault (disable via WD_DIS pin)

Any one of these faults causes the port to shutdown. Once a fault has occurred the port can not be repowered until a Disable function is sent. The Disable function clears the fault latch and the fault register.

INTB pin operation is essentially the same in PMM as in AM, with the following exceptions:

- For load under-current to generate a fault shutdown and status indication, the condition of load current less than the threshold must be detected by the continuous sample (C_SAMPLE) function (0111b).
- In PMM only, a Watchdog timer fault also asserts INTB.

Feature Description (continued)

9.4.2 Watchdog Timer

TPS2384 has two watchdog timers. One monitors the I²C clock and the other monitors the internal clock. When automode is selected and the watchdog timer has not been disabled only the internal clock is monitored. When in power management mode and the watchdog timer has not been disabled then both the I²C and internal clocks are monitored. If there is no I²C clock activity for approximately two seconds then all ports are disabled. There are three means to enable ports after a I²C clock fault and they are:

1. Hard power reset
2. PORB pulse
3. Writing a software reset to the Common Control register

In both auto mode and power management mode if the internal oscillator is lost for more than 20 ms all ports are disabled.

Loss of these signals is considered catastrophic since the system loses its ability to talk to each port. Therefore the watchdog timers disabling all ports protects the system.

This function can be easily over ridden by setting the WD_DIS pin high.

9.5 Device Functional Modes

9.5.1 Auto Mode

Auto mode (AM, MS = 0) operation is the basic approach for applying power to IEEE compliant PD's. When AM has been selected the TPS2384 automatically performs the following functions:

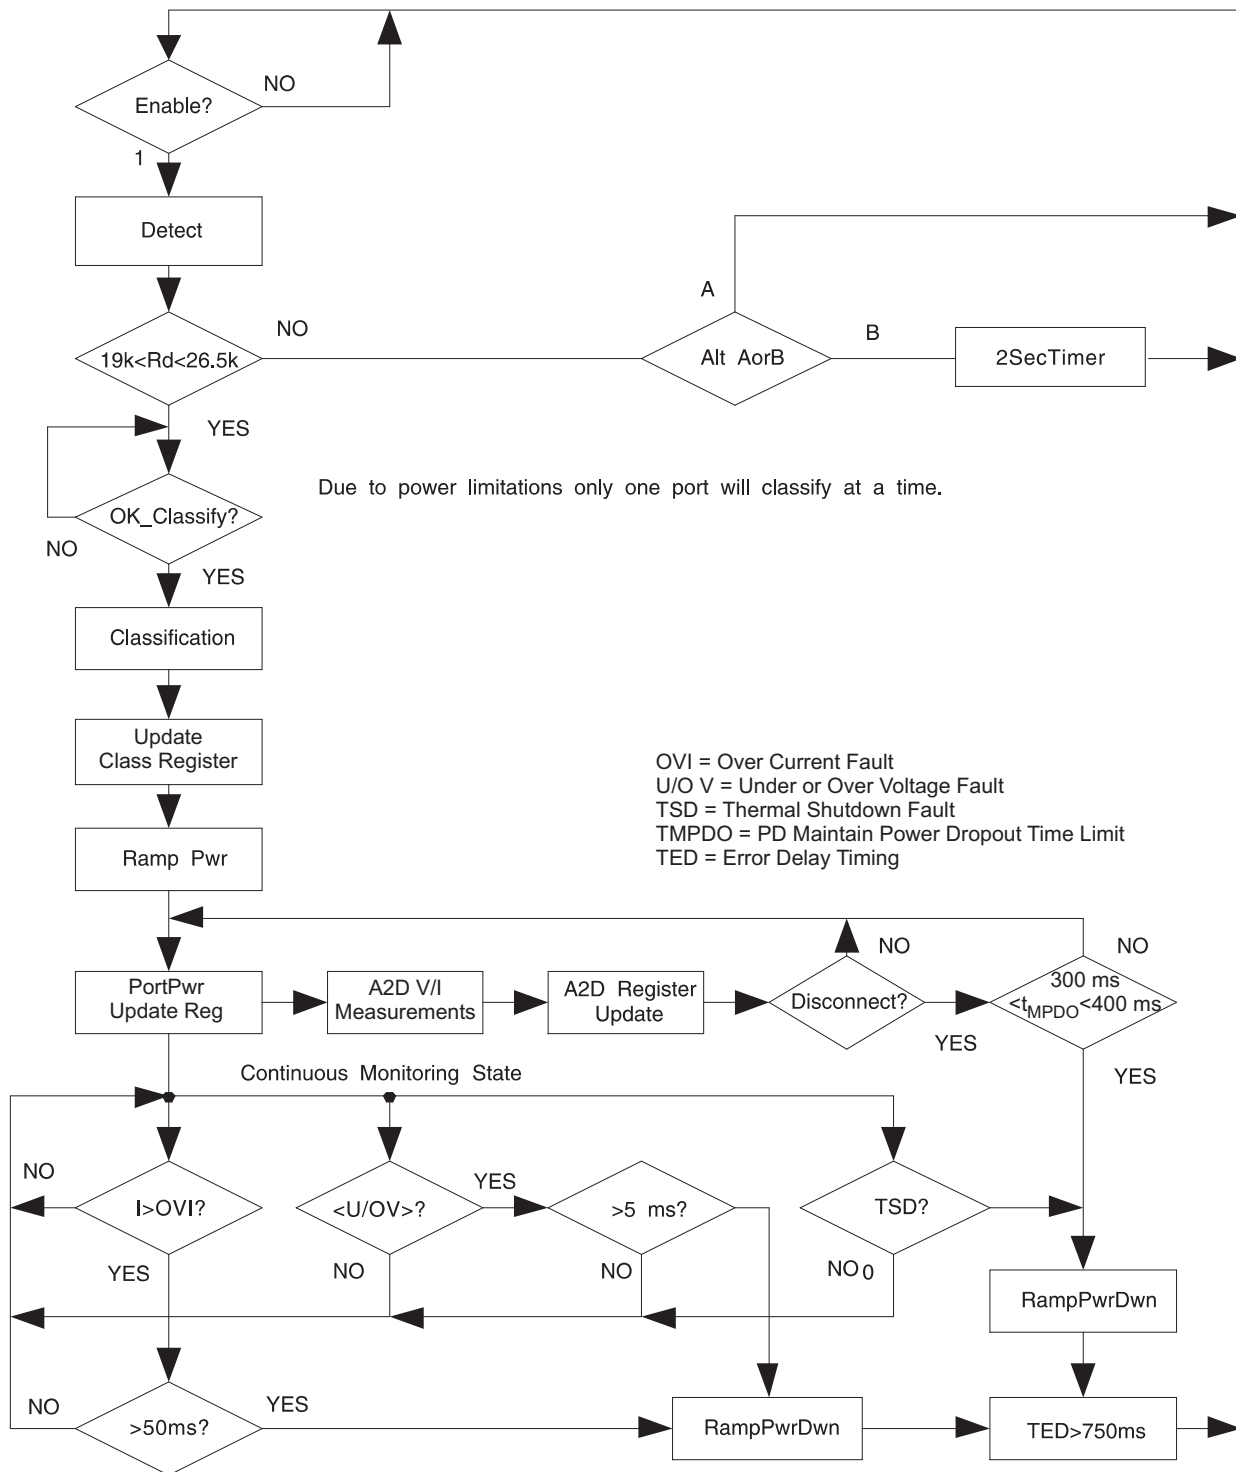

- Discovery of IEEE 802.3af compliant powered devices (PD's)
- Classification
- Power delivery
- Port over/under voltage detection
- Port over current detection ($350\text{ mA} < I_{\text{PORT}} < 400\text{ mA}$)
- Port maximum current limit ($400\text{ mA} < I_{\text{PORT}} < 450\text{ mA}$)
- DC Disconnect ($5\text{ mA} < I_{\text{PORT}} < 10\text{ mA}$)
- Thermal shutdown protection (TSD), ($T_J > 150^\circ\text{C}$)
- Internal oscillator watchdog

In AM the contents of all read registers are available via the I²C interface. In addition all control registers except for the function bits can be written. This supports a semi-automode where the TPS2384 auto detects compliant PD's while a host can access the A/D registers and class information and then implement power management (including turning a port off, responding to faults, etc).

The write registers that are still active in AM are:

- All ports disable – Common Control register 0001b
- Over/Under Voltage Faults – Common Control register 0001b
- Software reset – Common Control register 0001b
- Disconnect disable – Port Control 1 register 0010b
- Discovery fault disable – Port Control 1 register 0010b
- Port enable – Port Control 2 register 0011b

For Alternative B, semi-auto mode implementations which will manipulate the all Ports Disable or Port Enable bits, refer to ([SLUZ014](#)).

Device Functional Modes (continued)
9.5.2 Auto Mode Functional Description

Figure 5. The Basic Flow for Auto Mode

Device Functional Modes (continued)

9.5.2.1 AM Discovery

The TPS2384 uses a four-point measurement technique using two low level probe signals (typically 4.4 V and 8.8 V) during the discovery process to determine whether a valid PD is present. The use of a multipoint detection method for the PD resistor measurement allows accurate detection even when series steering diodes are present. The low level probe voltages also prevent damage to non-802.3 devices. When a valid PD has been detected the TPS2384 moves to classification. If a valid PD has not been detected the TPS2384 continues to cycle through the discovery process. The waveform in Figure 6 shows typical N-pin waveforms for the discovery of a valid PD and the failure to discovery due to a discovery resistor of 15 kΩ and 33 kΩ.

Figure 6. Invalid (33 kΩ and 15 kΩ) and Valid Discovery (25 kΩ)

Device Functional Modes (continued)

Upon completion of classification the port classification register is updated. In AM mode this information is not used but for semi-auto mode the class information can be used for power management. [Figure 8](#) shows actual class currents and the class assignment which were stored in the register. These assignments are compliant with the IEEE 802.3af Standard

Figure 8. Class Current and Class Assignments

Device Functional Modes (continued)

9.5.2.3 AM Power Delivery

After successfully discovery and classification of a valid PD the power is delivered by controlling the current to the PD until its current requirements are met or until the internal current limit is reached (approximately 425 mA). The power switch is fully enhanced after 500 μ s. Figure 9 show the voltage and the current that is being applied to the PD during power-up and reaching the PD load of 250 mA.

Figure 9. Port Power Delivery Voltage and Current

After power has been applied to the PD the TPS2384 automatically enters the current and voltage sample mode. The sample mode performs 31 current measurements and 1 voltage measurement. Each measurement takes approximately 18 ms to complete. The port remains powered and the current/voltage measurement cycle continues until a fault condition occurs. The current and voltage measurements are both stored in the A/D current and voltage registers and can be accessed through the I²C pins. This allows power management in the AM if it is desired.

9.5.3 AM Faults and INTB Output

AM faults are:

- Port under and over voltage faults
- Over current faults
- Under current (DC Disconnect) fault
- Thermal shutdown (TSD) fault
- Watchdog timer faults (disabled via WD_DIS pin)

Any one of the first four fault conditions listed above causes the port to shut down, and a 3-bit fault code to be latched into the affected port's Status Read 1 register (addr = 0100b). Watchdog faults cause all four ports to shut down. Faulted ports are temporarily disabled after a fault has been detected and latched.

The INTB pin is an open-drain, active-low output which is asserted if a fault condition occurs on any of the four ports. This indication is asserted for any of the port faults which result in a code displayed in the port status register (the faults listed in Table 8). In automode, the fault latch, the status register fault bits, and consequently, INTB assertion, are cleared by expiration of the 750-ms TED timer.

Device Functional Modes (continued)

9.5.5 Over Current or Current Limit Faults

Over current or current limit faults are conditions when the load current that is being sensed trips either the I_{CUT} comparator (350 mA to 400 mA) or the I_{LIM} comparator (400 mA to 450 mA) and turns on the current fault timer. When the over current timer reaches its time out limit that is set between 50 ms to 75 ms the corresponding port is turned off and the over current fault code generated in the Port Status 1 register. If the over current condition goes away prior to the over current timer reaching its limit the timer is reset and waits for the next event. [Figure 11](#) shows an over current fault lasting more than 50 ms that has caused the port to shut off.

Figure 11. Port Over-current Response

Device Functional Modes (continued)

9.5.6 Under Current Fault (DC Modulated Disconnect)

Under current fault (dc modulated disconnect) is a condition when the load current that is being measured drops below 7.5 mA and turns on the disconnect timer. If the disconnect timer reaches its time out limit that is set between 300 ms to 400 ms the corresponding port is turned off and the load disconnect fault code generated in the Port Status 1 register. If the under current condition goes away prior to the disconnect timer reaching its limit the timer is reset and the port remains powered.

Figure 12 shows DC Disconnect event. In this setup the load current was set right above the 7.5-mA threshold. The duty cycle of the load was then adjusted until the off period exceeded the disconnect time out, causing turn-off of the port. The time-out period was > 300 ms.

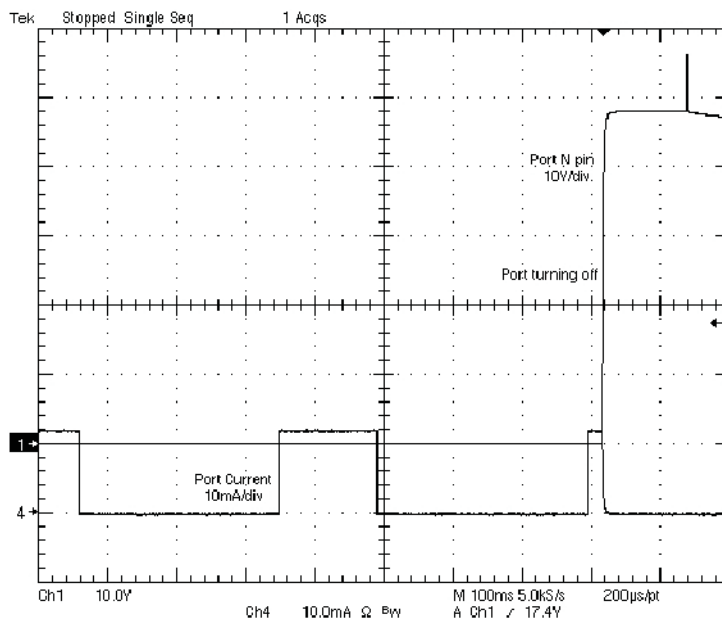

Figure 12. Port Under-current Response in DC Disconnect

Device Functional Modes (continued)

9.5.7 Power Management Mode (PMM)

Power management mode (PMM) has been designed to work efficiently with simple low-cost microcontrollers such as those in the MSP430 family.

The power management mode uses 13 self-contained functions to completely control the device operation. Simply write/read through the I²C pins and wait for the function done bit to be set. If an A/D measurement was performed during the function the results can be accessed by going to the read mode and addressing the proper register. Refer to [Figure 13](#) for more detail.

9.5.7.1 13 PMM Functions

- **Disable:** Disable the port and reset all functions.
- **Discovery 1:** Enable the Discovery 1 condition which applies a 4.4 V across the PD and measure and store the resulting current.
- **Discovery 2:** Enable the Discovery 2 condition which applies a 8.8 V across the PD and measure and store the resulting current.
- **V Sample:** Measure the voltage between the P and N pins and store the result in the A/D voltage register.
- **Legacy:** Enable the 3.5-mA current source for measuring capacitance and measure the voltage across the P and N terminals and store the result in the A/D voltage register.
- **Classify:** Enable the classification condition which applies 17.7 V across the PD and measure and store the resulting current.
- **Rup Pwr:** Turn on the output switch while controlling the current being delivered to the PD until the PD current needs are met or the max current is reached.
- **C Sample:** Continuous cycle of 31 current measurements and 1 voltage measurement. After each measurement the contents of the appropriate register are updated.
- **Rdwn:** Turn off the output switch while controlling current until output current reaches 0 mA.
- **AC LO:** Turns on low side output FET and measures voltage between P and N pin and store result in A/D voltage registers.
- **AC HI:** Turns on high side output FET and measures voltage between P and N pin and store result in A/D voltage registers.
- **ISample:** Measure the current and store the result in the A/D current register.
- **TSample:** Measure the internal die temperature and store the result in the A/D temperature register.

Conversion times for A/D measurements performed as part of the functions listed above are generally as shown in the typical values in the Electrical Characteristics table. However, conversion time is somewhat dependant on the magnitude of the input signal being measured. Power management mode applications should take precautions to test the A/D DONE bit (MSB of the high byte) of the pertinent results register before accepting or using the returned value. A logic 1 at this bit location indicates the conversion is complete. Also, once an A/D conversion is in process on a given port, subsequent function calls to that port should wait until the currently executing conversion is complete. Commands written prior to completion may cause the results of the initial conversion to be written to the register of the subsequent function.

Device Functional Modes (continued)

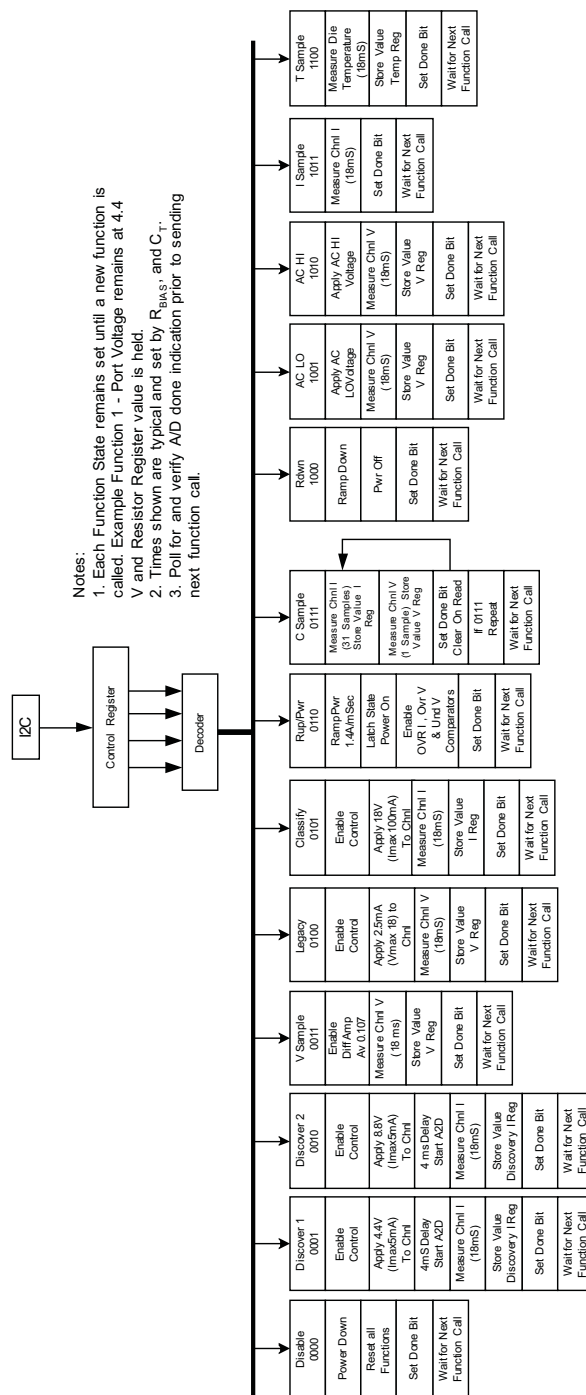

Figure 13. Device Process Function Flow

Device Functional Modes (continued)

9.5.8 PMM Discovery 1

PMM Discovery 1 function waveforms for the N and CINT pins are shown in Figure 14. The measurement is being performed using 25-kΩ impedance between the P and N pin. The Discovery 1 voltage is allowed to settle for approximately 5 ms before the A/D begins integrating. The voltage on the CINT pin shows the A/D cycle. There are four distinct regions to any A/D cycle: precharge (to a known starting voltage), charge, coarse discharge, and fine discharge. CINT pin is very high impedance therefore extreme care must be taken to avoid any noise or leakage affecting this pin. For the measurements where CINT voltage is shown a buffer was used to prevent performance degradation. The A/D measurement time is approximately 18 ms. The entire Discovery 1 function takes approximately 22 ms to complete. At the end of the A/D cycle the Discovery 1 current is stored in the Discovery Current Register and the function done bit is set. The applied Discovery 1 voltage level remains stored in the Discovery Current Register until another Discovery 1 or 2 function is called.

Figure 14. Discovery 1 Function Waveforms

Device Functional Modes (continued)

9.5.9 PMM Discovery 2

PMM Discovery 2 function waveforms for the N and CINT pins are shown in [Figure 15](#). Again the measurement is being performed using 25 k Ω impedance between the P and N pin. The Discovery 2 function was called after a Discovery 1 function so the voltage ramps from 4.4 V to 8.8 V below the P pin. The Discovery 2 voltage is given 5 ms to settle before the A/D begins to integrate. At the end of the A/D cycle the Discovery 2 current is stored in the Port Discovery Current Register and the function done bit is set. The applied Discovery 2 voltage level remains until a new function is called. The data for this measurement remains stored in the Discovery Current Register until another Discovery 1 or 2 function is called.

Figure 15. Discovery 2 Function Waveforms

Device Functional Modes (continued)

9.5.10 PMM Classification

PMM Classification function looks similar to Discovery 1 and 2 except that the voltage between the P and N pins regulates to approximately 17.5 V. At the end of the A/D cycle the classification current is stored in the Port Current Register and the done bit is set. The applied classification level remains until a new function is called. The data for this measurement remains stored in the Port Current Register until either the Classify or ISample function is called.

As indicated in the flow diagram of [Figure 5](#), the TPS2384 in AM only performs classification at one port at a time. Similarly, PMM applications should take care to ensure that only one port per device is put into the classification mode at any one time to limit power dissipation in the package.

9.5.11 PMM Legacy

PMM Legacy function is used to detect PDs that are non compliant. Legacy detection uses a current source (typically 3.5 mA) as a test current while the A/D measures the average voltage for approximately 18 ms. The waveform shown in [Figure 16](#) is the Legacy function charging a 10-μF capacitor. The capacitance charges to a value that is no greater than 20 V below the P port voltage. As the capacitor is charging the A/D is accumulating counts in the voltage A/D register. [Figure 17](#) shows the relationship between port capacitance and the number of counts. A user can characterize non-compliant PD's signatures and use the Legacy function to recognize these devices.

Figure 16. Legacy Detection Function Waveforms

Figure 17. A/D Counts vs Legacy Port Capacitance

Device Functional Modes (continued)

9.5.12 PMM Rup Pwr

PMM Rup Pwr function turns on the port power by ramping up the current that is being delivered to the load in a controlled fashion. The output current ramps from 0 mA to I_{LIM} (typically 425 mA) in approximately 500 μ s. Figure 18 shows the output voltage and current turning on for a 250-mA load.

Figure 18. Rup Pwr Function Waveforms

Device Functional Modes (continued)

9.5.13 PMM R_{DWN}

PMM R_{DWN} function turns off the port power by ramping down the current in a controlled fashion. The output current ramps from I_{LIM} (typically 425 mA) to 0 mA in approximately 300 μ s. Figure 19 shows the output voltage and current shutting down for a 250-mA load.

Figure 19. Rdown Function Waveforms

9.6 Programming

9.6.1 I²C Interface Description

The serial interface used in the TPS2384 is a standard 2-wire I²C slave architecture. The standard SDA line of the I²C architecture is broken out into independent input and output data paths. This feature simplifies earth grounded controller applications that require opto-isolators to keep the 48-V return of the Ethernet power system floating. For applications where opto-isolation is not required, the bidirectional property of the SDA line can be restored by connecting SDA_I to SDA_O. The SCL line is a unidirectional input only line as the TPS2384 is always accessed as a slave device and it never masters the bus.

Data transfers that require a data-flow reversal on the SDA line are 4-byte operations. This occurs during a TPS2384 port read cycle where a slave address byte is sent, followed by a port/register address byte write. A second slave address byte is sent followed by the data byte read using the port/register setup from the second byte in the sequence.

The I²C interface and the port read write registers are held in active reset until all input voltages are within specifications (V10, V6.3, V3.3 and V2.5) and the internal POR timer has timed out (see electrical specifications).

The I²C read cycle consists of the following steps 1 through 14 and is shown in [Figure 20](#):

1. Start Sequence (S)
2. Device address field
3. Write
4. Acknowledge
5. Register/Port address
6. Acknowledge
7. Stop
8. Start
9. Device address field
10. Read
11. Acknowledge
12. Data Transfer
13. Acknowledge
14. Stop

Data write transfers to the TPS2384 do not require a data-flow reversal and as such only a 3-byte operation is required. The sequence in this case would be to send a slave device address byte, followed by a write of the port/register address followed by a write of the data byte for the addressed port.

The I²C write cycle consists of the following steps 1 through 9 and is also shown in [Figure 20](#):

1. Start Sequence (S)
2. Device address field
3. Write
4. Acknowledge
5. Register/Port address
6. Acknowledge
7. Data for TPS2384
8. Acknowledge
9. Stop

Programming (continued)

9.6.2 Start/Stop

The high-to-low transition of SDA_I while SCL is high defines the start condition. The low to high transition of SDA_I while SCL is high defines the stop condition. The master device initiates all start and stop conditions.

The first serial packet is enclosed within start and stop bits, consists of a 7-bit address field, read/write bit, and the acknowledge bit. The acknowledge bit is always generated by the device receiving the address or data field. Five of the seven address bits are used by the TPS2384. The value of the sixth and seventh bit is ignored. (See Note ⁽¹⁾ in Table 1)

9.6.3 Chip Address

The address field of the TPS2384 is 8 bits long and contains 5 bits of device address select, a read/write bit, and two spare bits per Table 1. The five device address select bits follow this plan. These bits are compared against the hard-wired state of the corresponding device address select pins (A1–A5). When the field contents are equivalent to the pin logic states, the device is addressed. These bits are followed by LSB bit, which is used to set the read or write condition (1 for read and 0 for write). Following a start condition and an address field, the TPS2384 responds with an acknowledge by pulling the SDA_O line low during the 9th clock cycle if the address field is equivalent to the value programmed by the pins. The SDA_O line remains a stable low while the 9th clock pulse is high.

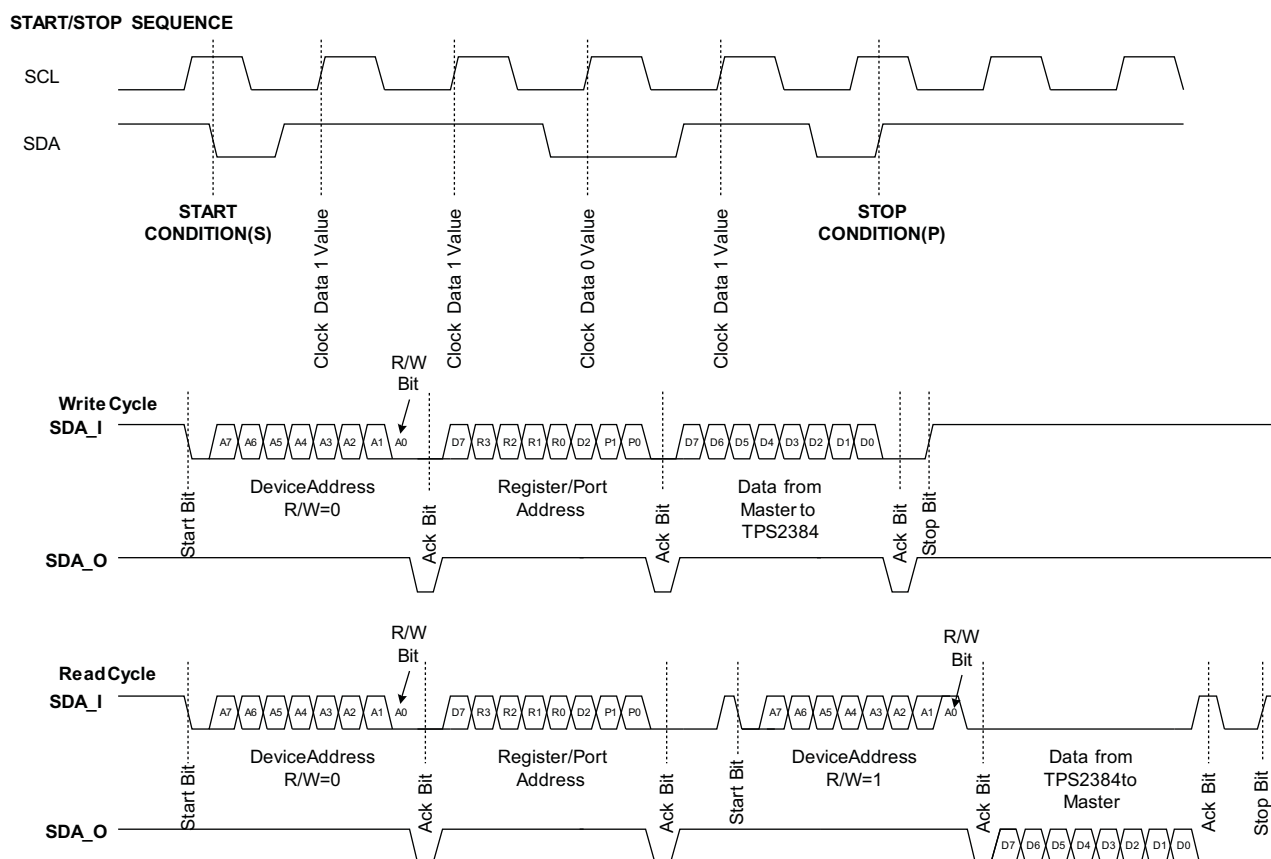

Figure 20. I²C Read/Write Cycles

- (1) TPS2384 will acknowledge four slave address values for each setting of A5-A1 (A7,A6 = 00, 01, 10, 11). Slave devices sharing the bus with TPS2384(s) should use unique A5-A1 values not matching those of the TPS2384(s).

Programming (continued)

9.6.4 Chip Addressing

Table 1 shows the bit assignments during the addressing cycle.

Table 1. Address Selection Field

BIT	FUNCTION
A7	Future expansion (value not compared) ⁽¹⁾
A6	Future expansion (value not compared) ⁽¹⁾
A5	Device address. Compared with pin A5
A4	Device address. Compared with pin A4
A3	Device address. Compared with pin A3
A2	Device address. Compared with pin A2
A1	Device address LSB. Compared with pin A1
A0	Read/Write

- (1) TPS2384 will acknowledge four slave address values for each setting of A5-A1 (A7,A6 = 00, 01, 10, 11). Slave devices sharing the bus with TPS2384(s) should use unique A5-A1 values not matching those of the TPS2384(s).

9.6.5 Data Write Cycle

For a data write sequence, after the Port/Register address cycle, the TPS2384 accepts the eight bits of data as defined in the tables below. The data is latched into the previously selected Write Register, and the TPS2384 generates a data acknowledge pulse by pulling the SDA_O line low for one clock cycle. Common register functions act on all ports simultaneously. Per port registers are specific to the target port only.

To reset the interface, the host or master subsequently generates a stop bit by releasing the SDA_I line during the clock-high portion of an SCL pulse.

9.6.6 Port/Register Cycle

After the chip address cycle, the TPS2384 accepts eight bits of port/register select data as defined in Table 2. The SCL line high-to-low transition after the eighth data bit then latches the selection of the appropriate internal register for the follow-on data read or write operation. After latching the eight-bit data field, the TPS2384 pulls the SDA_O line low for one clock cycle, for the acknowledge pulse.

9.6.7 Data Read Cycle

For a data read sequence, after the register acknowledge bit, the master device generates a stop condition. This is followed by a second start condition, and retransmitting the device address as described in chip address above. For this cycle, however, the R/W bit is set to a 1 to signal the read operation. The TPS2384 again responds with an acknowledge pulse. The address acknowledge is then followed by sequentially presenting each of the eight data bits on the SDA_O line (MSB first), to be read by the host device on the rising edges of SCL. After eight bits are transmitted, the host acknowledges by pulling the SDA_I line high for one clock pulse. The completed data transfer is terminated with the host generating a stop condition.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The TPS2384 is a quad-port PSEPM can be used in simple, low port count, automatic or high port count micro-controller managed applications.

10.1.1 AC Disconnect Drive Circuit Detail

TPS2384 AC_HI and AC_LO can be used with the port generator drive circuit shown in [Figure 37](#) for up to 16 ports. Detailed component specifications can be found in the TPS2384EVM User Guide, ([SLVU126](#)).

Figure 37. AC_HI and LOW Without External FET Configurations

10.1.2 Connection of Unused Ports and Pins

The TPS2384 can be used on applications needing only 1 to 4 ports. For unused ports follow the guidelines shown in ([SLVA231](#)).

10.1.3 Opto-isolator Interface

The TPS2384 can be used in applications requiring digital isolation of the I²C signals. The detailed design procedure and component selection can be found in ([SLVA229](#)).

10.1.4 Port Protection from Electrical Transients

Detailed design procedure and component selection for electrical transient protection of ports can be found in ([SLVA233](#)).

10.2 Typical Application

This section provides a typical application example for a four port PSE system. The detailed schematic for a basic 4 PORT (PMM) isolated configuration with AC Disconnect is shown in [Figure 38](#) (PAP pinout shown).

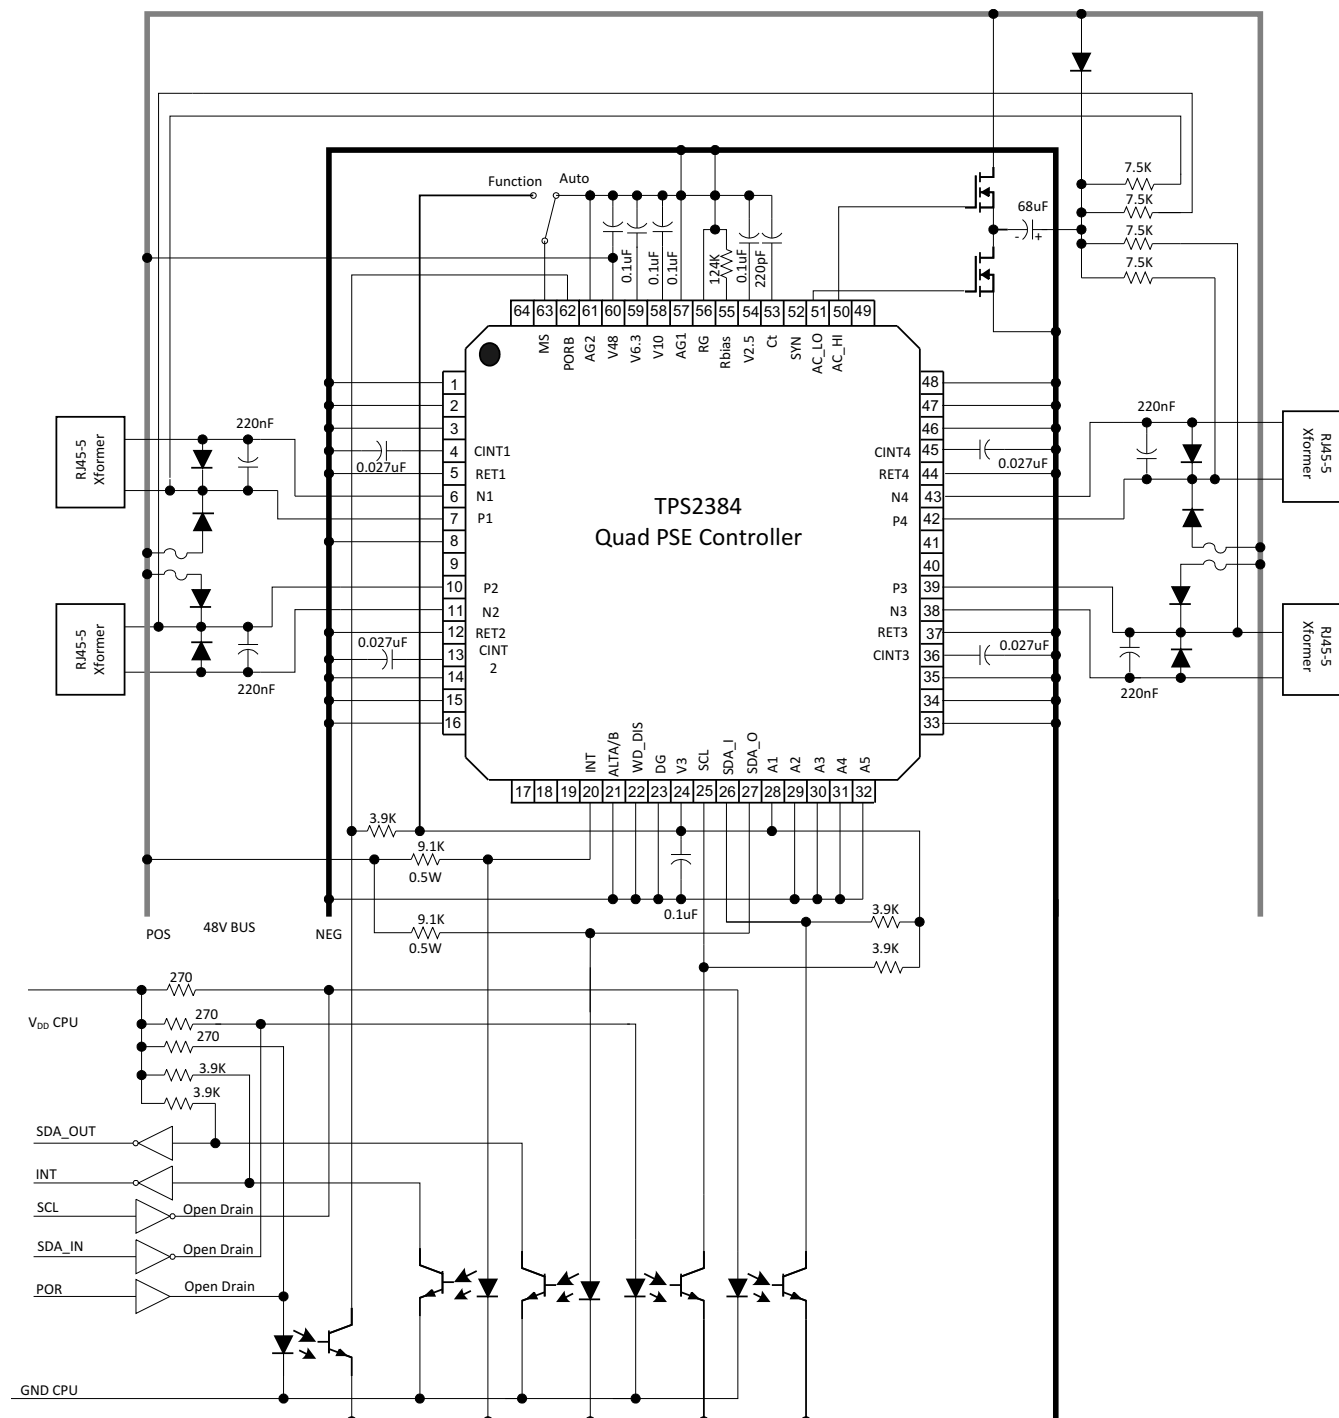

Figure 38. Basic 4 PORT (PMM) Isolated Configuration with AC Disconnect

Typical Application (continued)

10.2.1 Design Requirements

For this design example, use the parameters shown in [Table 18](#)

Table 18. Design Parameters

PARAMETER	VALUE
Input voltage	48 V \pm 3 V
Input current	1.52 A \pm 0.1 A (fully loaded ports)
Number of ports	4
Other requirements	AC Disconnect Detection

10.2.2 Detailed Design Procedure

10.2.2.1 Power Pin Bypass Capacitors

- V48: Connect a 0.1 μ F, 100V, X7R ceramic capacitor from V48 to AG1 as close to the device as possible.
- V10: Connect a 0.1 μ F, 25V, X7R ceramic capacitor from V10 to AG1 as close to the device as possible.
- V6.3: Connect a 0.1 μ F, 10V, X7R ceramic capacitor from V6.3 to AG1 as close to the device as possible.
- V3.3: Connect a 0.1 μ F, 10V, X7R ceramic capacitor from V3.3 to DG as close to the device as possible.
- V2.5: Connect a 0.1 μ F, 10V, X7R ceramic capacitor from V2.5 to RG as close to the device as possible.

10.2.2.2 Per Port Components

- Port capacitor: Connect a 220 nF – 470 nF, 100 V, X7R ceramic capacitor from Px to Nx.
- Fuse: The port fuse should be a slow blow type rated for at least 60 VDC and 1 A. A resettable Polyfuse may also be used.
- Protection Diodes: The port TVS should be rated for the expected port surge environment. The TVS should have a minimum reverse standoff voltage of 58 V and a maximum clamping voltage of 95 V at the expected peak surge current. The negative clamp diode should be rated for $V_R = 100$ V minimum and be able to survive the expected negative surge current. Low forward voltage drop at the rated current is essential.
- Integration capacitor: Connect a 0.027 μ F, 16 V minimum, polycarbonate, poly-propylene, polystyrene, teflon, or other low leakage capacitor from CINTx to RG as close to the device as possible.

10.2.2.3 Bias and Timing

- Bias resistor: Connect a 124 k Ω , 1/16W, 1% chip resistor from RBIAS to RG as close to the device as possible.
- Timing Capacitor: Connect a 220 pF, 25 V, COG, 2% ceramic capacitor from CT to RG as close to the device as possible.

10.2.3 Application Curves

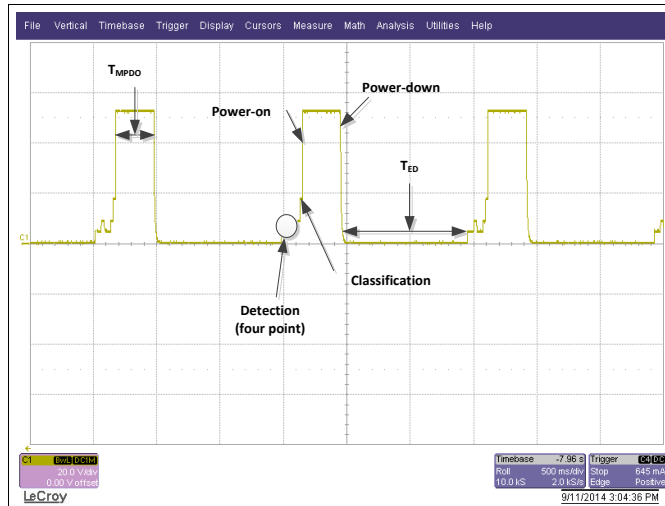

Figure 39. Good Detect, Class, Power-on, Followed by Under-current Disconnect

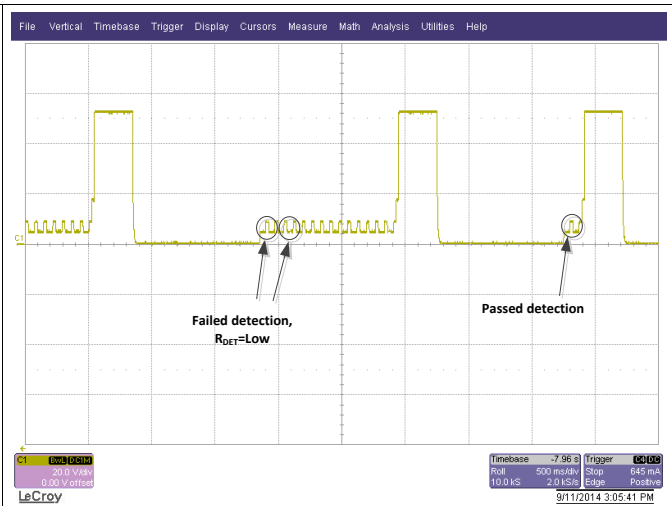

Figure 40. Marginal Detect, Class, Power-on Followed by Under-current Disconnect

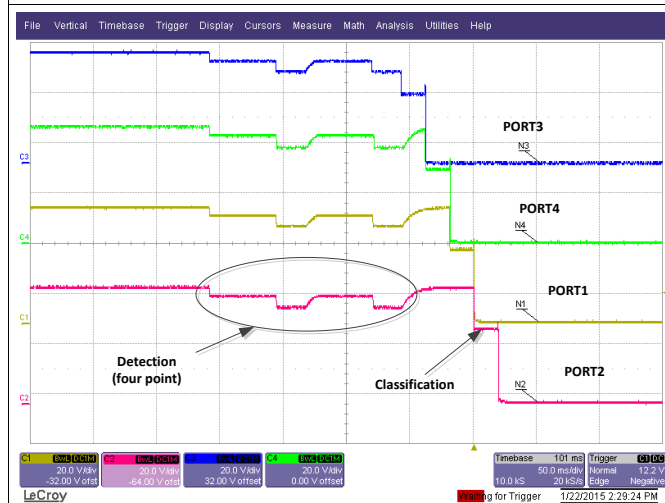

Figure 41. Four Port Power on Sequence after TPS2384 POR Pin De-assertion

Figure 42. 48-V Supply Current During Four Port Start up Sequence (After POR Pin De-assertion)

11 Power Supply Recommendations

The recommended V48 supply voltage requirement is 44 V to 57 V. A power supply with a nominal 48-V output can support type 1 PD requirements. The output current required from the V48 supply depends on the number of ports required in the system. ICUT for a type 1 port is 375 mA \pm 25 mA. Size the V48 supply accordingly for the number of ports to be supported.

The V3.3 digital supply can be used externally for light loads less than 3 mA.

12 Layout

12.1 Layout Guidelines

12.1.1 Local Circuits

- V48: Place the V48 capacitor from V48 to AG1 as close to the device as possible.
- V10: Place the V10 capacitor from V10 to AG1 as close to the device as possible.
- V6.3: Place the V6.3 capacitor from V6.3 to AG1 as close to the device as possible.
- V3.3: Place the V3.3 capacitor from V3.3 to DG as close to the device as possible.
- V2.5: Place the V2.5 capacitor from V2.5 to RG as close to the device as possible.
- RBIAS: Place the RBIAS resistor from RBIAS to RG on PCB topside as close to the device as possible.
- CT: Place the CT capacitor from CT to RG on PCB topside as close to the device as possible.
- CINTx: Place the CINTx capacitors from CINTx to RG on PCB topside as close to the device as possible.

12.1.2 System Protection Circuits

These circuits will include the per-port capacitor, fuse, protection diodes, common mode filtering (ferrite beads or chokes), Bob Smith terminations and AC disconnect generator components. Detailed layout and placement guidelines can be found in [SLVA233](#).

12.2 Layout Example

13.2 Trademarks

PowerPAD is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

13.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

13.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

14.1 Thermal Consideration

Ensure proper thermal management of TPS2384 by following the example board layout guidelines provided in the *LAND PATTERN DATA* section.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. THERMAL PAD MECHANICAL DATA

PAP (S-PQFP-G64)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PowerPAD is a trademark of Texas Instruments

PJD (S-PQFP-G64) PowerPAD™ PLASTIC QUAD FLATPACK (DIE DOWN)

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusion.
 - D. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>. See the product data sheet for details regarding the exposed thermal pad dimensions.
 - E. Falls within JEDEC MS-026

THERMAL PAD MECHANICAL DATA

PJD (S-PQFP-G64)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: A. All linear dimensions are in millimeters

B. Tie strap features may not be present.

PJD (S-PQFP-G64)

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
