

TMS320C6654

Fixed and Floating-Point Digital Signal Processor

Data Manual

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Literature Number: SPRS841A
August 2012

Release History

Revision	Date	Description/Comments
SPRS814A	August 2012	<ul style="list-style-type: none">• Updated Tracer descriptions across the data manual• Updated McBSP Timing Requirements table• Updated Thermal Characteristics data• Added footnote for DDR3 EMIF data in memory map summary table• Added CVDD and SmartReflex voltage parameter in SmartReflex switching table• Removed DDR3 PLL initialization sequence from data manual to PLL controller user guide
SPRS814	March 2012	<ul style="list-style-type: none">• Initial release

For detailed revision information, see [“Revision History”](#) on page A-227.

TMS320C6654
Fixed and Floating-Point Digital Signal Processor

SPRS841A—August 2012

www.ti.com

1 Features

- **One TMS320C66x™ DSP Core Subsystem (CorePac) With**
 - **850 MHz C66x Fixed/Floating-Point CPU Core**
 - › 27.2 GMAC/Core for Fixed Point @ 850 MHz
 - › 13.6 GFLOP/Core for Floating Point @ 850 MHz
 - **Memory**
 - › 32K Byte L1P Per Core
 - › 32K Byte L1D Per Core
 - › 1024K Byte Local L2 Per Core
- **Multicore Shared Memory Controller (MSMC)**
 - **Memory Protection Unit for DDR3_EMIF**
- **Multicore Navigator**
 - **8192 Multipurpose Hardware Queues with Queue Manager**
 - **Packet-Based DMA for Zero-Overhead Transfers**
- **Peripherals**
 - **PCIe Gen2**
 - › **Single Port Supporting 1 or 2 Lanes**
 - › **Supports Up To 5 GBaud Per Lane**
 - **Gigabit Ethernet (GbE) Subsystem**
 - › **One SGMII Port**
 - › **Supports 10/100/1000 Mbps Operation**
 - **32-Bit DDR3 Interface**
 - › **DDR3-1066**
 - › **8G Byte Addressable Memory Space**
 - **16-Bit EMIF**
 - **Universal Parallel Port**
 - › **Two Channels of 8 bits or 16 bits Each**
 - › **Supports SDR and DDR Transfers**
 - **Two UART Interfaces**
 - **Two Multichannel Buffered Serial Ports (McBSP)**
 - **I²C Interface**
 - **32 GPIO Pins**
 - **SPI Interface**
 - **Semaphore Module**
 - **Eight 64-Bit Timers**
 - **Two On-Chip PLLs**
 - **SoC Security Support**
- **Commercial Temperature:**
 - **0°C to 85°C**
- **Extended Temperature:**
 - **-40°C to 100°C**
- **Extended Low Temperature:**
 - **-55°C to 100°C**

1.1 KeyStone Architecture

TI's KeyStone Multicore Architecture provides a high performance structure for integrating RISC and DSP cores with application specific coprocessors and I/O. KeyStone is the first of its kind that provides adequate internal bandwidth for nonblocking access to all processing cores, peripherals, coprocessors, and I/O. This is achieved with four main hardware elements: Multicore Navigator, TeraNet, Multicore Shared Memory Controller, and HyperLink.

Multicore Navigator is an innovative packet-based manager that controls 8192 queues. When tasks are allocated to the queues, Multicore Navigator provides hardware-accelerated dispatch that directs tasks to the appropriate available hardware. The packet-based system on a chip (SoC) uses the two Tbps capacity of the TeraNet switched central resource to move packets. The Multicore Shared Memory Controller enables processing cores to access shared memory directly without drawing from TeraNet's capacity, so packet movement cannot be blocked by memory access.

HyperLink provides a 40-Gbaud chip-level interconnect that allows SoCs to work in tandem. Its low-protocol overhead and high throughput make HyperLink an ideal interface for chip-to-chip interconnections. Working with Multicore Navigator, HyperLink dispatches tasks to tandem devices transparently and executes tasks as if they are running on local resources.

1.2 Device Description

The TMS320C6654 DSP is a highest-performance fixed/floating-point DSP that is based on TI's KeyStone multicore architecture. Incorporating the new and innovative C66x DSP core, this device can run at a core speed of up to 850 MHz. For developers of a broad range of applications, such as mission critical, medical imaging, test and automation, and other applications requiring high performance, TI's TMS320C6654 DSP offers up to 850 MHz cumulative DSP and enables a platform that is power-efficient and easy to use. In addition, it is fully backward compatible with all existing C6000 family of fixed and floating point DSPs.

TI's KeyStone architecture provides a programmable platform integrating various subsystems (C66x cores, memory subsystem, peripherals, and accelerators) and uses several innovative components and techniques to maximize intra-device and inter-device communication that allows the various DSP resources to operate efficiently and seamlessly. Central to this architecture are key components such as Multicore Navigator that allows for efficient data management between the various device components. The TeraNet is a non-blocking switch fabric enabling fast and contention-free internal data movement. The multicore shared memory controller allows access to shared and external memory directly without drawing from switch fabric capacity.

For fixed-point use, the C66x core has 4× the multiply accumulate (MAC) capability of C64x+ cores. In addition, the C66x core integrates floating point capability and the per core raw computational performance is an industry-leading 27.2 GMACS/core and 13.6 GFLOPS/core (@850 MHz frequency). It can execute 8 single precision floating point MAC operations per cycle and can perform double- and mixed-precision operations and is IEEE754 compliant. The C66x core incorporates 90 new instructions (compared to the C64x+ core) targeted for floating point and vector math oriented processing. These enhancements yield sizeable performance improvements in popular DSP kernels used in signal processing, mathematical, and image acquisition functions. The C66x core is backwards code compatible with TI's previous generation C6000 fixed and floating point DSP cores, ensuring software portability and shortened software development cycles for applications migrating to faster hardware.

The C6654 DSP integrates a large amount of on-chip memory. In addition to 32KB of L1 program and data cache, there is 1024KB of dedicated memory per core that can be configured as mapped RAM or cache. All L2 memories incorporate error detection and error correction. For fast access to external memory, this device includes a 32-bit DDR-3 external memory interface (EMIF) running at 1066 MHz and has ECC DRAM support.

This family supports a number of high speed standard interfaces, PCI Express Gen2, and Gigabit Ethernet. It also includes I²C, UART, Multichannel Buffered Serial Port (McBSP), Universal Parallel Port, and a 16-bit asynchronous EMIF, along with general purpose CMOS IO.

The C6654 device has a complete set of development tools, which includes: an enhanced C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows® debugger interface for visibility into source code execution.

1.3 Functional Block Diagram

2 Device Overview

2.1 Device Characteristics

Table 2-1 Characteristics of the TMS320C6654 Processor

HARDWARE FEATURES		TMS320C6654
Peripheral	DDR3 Memory Controller (32-bit bus width) [1.5 V I/O] (clock source = DDRREFCLKN P)	1
	DDR3 Maximum Data Rate	1066
	EDMA3 (64 independent channels) [DSP/3 clock rate]	1
	PCIe (2 lanes)	1
	10/100/1000 Ethernet	1
	Management Data Input/Output (MDIO)	1
	EMIF16	1
	McBSP	2
	SPI	1
	UART	2
	uPP	1
	I ² C	1
	64-Bit Timers (configurable) (internal clock source = CPU/6 clock frequency)	8 (each configurable as two 32-bit timers)
General-Purpose Input/Output port (GPIO)	32	
On-Chip Memory	CorePac Memory	32KB L1 Program Memory [SRAM/Cache] 32KB L1 Data Memory [SRAM/Cache] 1024KB L2 Unified Memory/Cache
	ROM Memory	128KB L3 ROM
C66x CorePac Revision ID	CorePac Revision ID Register (address location: 0181 2000h)	See Section 5.5 "C66x CorePac Revision" on page 102.
JTAG BSDL_ID	JTAGID register (address location: 0262 0018h)	See Section 3.3.3 "JTAG ID (JTAGID) Register Description" on page 71
Frequency	MHz	850 (0.85 GHz)
Cycle Time	ns	1.175 (0.85 GHz)
Voltage	Core (V)	SmartReflex variable supply
	I/O (V)	1.0 V, 1.5 V, and 1.8 V
Process Technology	μm	0.040 μm
BGA Package	21 mm × 21mm	625-Pin Flip-Chip Plastic BGA (CZH or GZH)
Product Status ⁽¹⁾	Product Preview (PP), Advance Information (AI), or Production Data (PD)	PD
End of Table 2-1		

¹ PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

2.2 DSP Core Description

The C66x Digital Signal Processor (DSP) extends the performance of the C64x+ and C674x DSPs through enhancements and new features. Many of the new features target increased performance for vector processing. The C64x+ and C674x DSPs support 2-way SIMD operations for 16-bit data and 4-way SIMD operations for 8-bit data. On the C66x DSP, the vector processing capability is improved by extending the width of the SIMD instructions. C66x DSPs can execute instructions that operate on 128-bit vectors. For example the QMPY32 instruction is able to perform the element-to-element multiplication between two vectors of four 32-bit data each. The C66x DSP also supports SIMD for floating-point operations. Improved vector processing capability (each instruction can process multiple data in parallel) combined with the natural instruction level parallelism of C6000 architecture (e.g execution of up to 8 instructions per cycle) results in a very high level of parallelism that can be exploited by DSP programmers through the use of TI's optimized C/C++ compiler.

The C66x DSP consists of eight functional units, two register files, and two data paths as shown in Figure 2-1. The two general-purpose register files (A and B) each contain 32 32-bit registers for a total of 64 registers. The general-purpose registers can be used for data or can be data address pointers. The data types supported include packed 8-bit data, packed 16-bit data, 32-bit data, 40-bit data, and 64-bit data. Multiplies also support 128-bit data. 40-bit-long or 64-bit-long values are stored in register pairs, with the 32 LSBs of data placed in an even register and the remaining 8 or 32 MSBs in the next upper register (which is always an odd-numbered register). 128-bit data values are stored in register quadruplets, with the 32 LSBs of data placed in a register that is a multiple of 4 and the remaining 96 MSBs in the next 3 upper registers.

The eight functional units (.M1, .L1, .D1, .S1, .M2, .L2, .D2, and .S2) are each capable of executing one instruction every clock cycle. The .M functional units perform all multiply operations. The .S and .L units perform a general set of arithmetic, logical, and branch functions. The .D units primarily load data from memory to the register file and store results from the register file into memory.

Each C66x .M unit can perform one of the following fixed-point operations each clock cycle: four 32×32 bit multiplies, sixteen 16×16 bit multiplies, four 16×32 bit multiplies, four 8×8 bit multiplies, four 8×8 bit multiplies with add operations, and four 16×16 multiplies with add/subtract capabilities. There is also support for Galois field multiplication for 8-bit and 32-bit data. Many communications algorithms such as FFTs and modems require complex multiplication. Each C66x .M unit can perform one 16×16 bit complex multiply with or without rounding capabilities, two 16×16 bit complex multiplies with rounding capability, and a 32×32 bit complex multiply with rounding capability. The C66x can also perform two 16×16 bit and one 32×32 bit complex multiply instructions that multiply a complex number with a complex conjugate of another number with rounding capability. Communication signal processing also requires an extensive use of matrix operations. Each C66x .M unit is capable of multiplying a $[1 \times 2]$ complex vector by a $[2 \times 2]$ complex matrix per cycle with or without rounding capability. A version also exists allowing multiplication of the conjugate of a $[1 \times 2]$ vector with a $[2 \times 2]$ complex matrix.

Each C66x .M unit also includes IEEE floating-point multiplication operations from the C674x DSP, which includes one single-precision multiply each cycle and one double-precision multiply every 4 cycles. There is also a mixed-precision multiply that allows multiplication of a single-precision value by a double-precision value and an operation allowing multiplication of two single-precision numbers resulting in a double-precision number. The C66x DSP improves the performance over the C674x double-precision multiplies by adding a instruction allowing one double-precision multiply per cycle and also reduces the number of delay slots from 10 down to 4. Each C66x .M unit can also perform one the following floating-point operations each clock cycle: one, two, or four single-precision multiplies or a complex single-precision multiply.

The .L and .S units can now support up to 64-bit operands. This allows for new versions of many of the arithmetic, logical, and data packing instructions to allow for more parallel operations per cycle. Additional instructions were added yielding performance enhancements of the floating point addition and subtraction instructions, including the ability to perform one double precision addition or subtraction per cycle. Conversion to/from integer and single-precision values can now be done on both .L and .S units on the C66x. Also, by taking advantage of the larger

operands, instructions were also added to double the number of these conversions that can be done. The .L unit also has additional instructions for logical AND and OR instructions, as well as, 90 degree or 270 degree rotation of complex numbers (up to two per cycle). Instructions have also been added that allow for the computing the conjugate of a complex number.

The MFENCE instruction is a new instruction introduced on the C66x DSP. This instruction will create a DSP stall until the completion of all the DSP-triggered memory transactions, including:

- Cache line fills
- Writes from L1D to L2 or from the CorePac to MSMC and/or other system endpoints
- Victim write backs
- Block or global coherence operations
- Cache mode changes
- Outstanding XMC prefetch requests

This is useful as a simple mechanism for programs to wait for these requests to reach their endpoint. It also provides ordering guarantees for writes arriving at a single endpoint via multiple paths, multiprocessor algorithms that depend on ordering, and manual coherence operations.

For more details on the C66x DSP and its enhancements over the C64x+ and C674x architectures, see the following documents:

- *C66x CPU and Instruction Set Reference Guide* in [“Related Documentation from Texas Instruments”](#) on page 64.
- *C66x DSP Cache User Guide* in [“Related Documentation from Texas Instruments”](#) on page 64.
- *C66x CorePac User Guide* in [“Related Documentation from Texas Instruments”](#) on page 64.

End of Table 2-2					

¹ 32MB per chip select for 16-bit NOR and SRAM. 16MB per chip select for 8-bit NOR and SRAM. The 32MB and 16MB size restrictions do not apply to NAND.

² The memory map only shows the default MPAX configuration of DDR3 memory space. For the extended DDR3 memory space access (up to 8GB), please refer to the MPAX configuration details in *C66x CorePac User Guide* and *Multicore Shared Memory Controller (MSMC) for KeyStone Devices User Guide* in [“Related Documentation from Texas Instruments”](#) on page 64.

2.4 Boot Sequence

The boot sequence is a process by which the DSP's internal memory is loaded with program and data sections. The DSP's internal registers are programmed with predetermined values. The boot sequence is started automatically after each power-on reset, warm reset, and system reset. A local reset to an individual C66x CorePac should not affect the state of the hardware boot controller on the device. For more details on the initiators of the resets, see section 7.4 [“Reset Controller”](#) on page 119. The bootloader uses a section of the L2 SRAM (start address 0x0087 2DC0 and end address 0x0087 FFFF) during initial booting of the device. For more details on the type of configurations stored in this reserved L2 section see the *Bootloader for the C66x DSP User Guide* in [“Related Documentation from Texas Instruments”](#) on page 64.

The C6654 supports several boot processes that begins execution at the ROM base address, which contains the bootloader code necessary to support various device boot modes. The boot processes are software-driven and use the BOOTMODE[12:0] device configuration inputs to determine the software configuration that must be completed. For more details on Boot Sequence see the *Bootloader for the C66x DSP User Guide* in [“Related Documentation from Texas Instruments”](#) on page 64.

2.5 Boot Modes Supported and PLL Settings

The device supports several boot processes, which leverage the internal boot ROM. Most boot processes are software driven, using the BOOTMODE[2:0] device configuration inputs to determine the software configuration that must be completed. From a hardware perspective, there are two possible boot modes:

- **Public ROM Boot** - C66x CorePac0 is released from reset and begins executing from the L3 ROM base address. After performing the boot process (e.g., from I²C ROM, Ethernet, or RapidIO), C66x CorePac0 then begins execution from the provided boot entry point. See the *Bootloader for the C66x DSP User Guide* in [“Related Documentation from Texas Instruments”](#) on page 64 for more details.
- **Secure ROM Boot** - On secure devices, the C66x CorePac0 is released from reset and begin executing from secure ROM. Software in the secure ROM will free up internal RAM pages, after which C66x CorePac0 initiates the boot process. The C66x CorePac0 performs any authentication and decryption required on the bootloaded image prior to beginning execution.

The boot process performed by the C66x CorePac0 in public ROM boot and secure ROM boot are determined by the BOOTMODE[12:0] value in the DEVSTAT register. The C66x CorePac0 reads this value, and then executes the associated boot process in software. Figure 2-2 shows the bits associated with BOOTMODE[12:0].

2.5.2.5 I²C Boot Device Configuration

2.5.2.5.1 I²C Master Mode

In master mode, the I²C device configuration uses ten bits of device configuration instead of seven as used in other boot modes. In this mode, the device will make the initial read of the I²C EEPROM while the PLL is in bypass mode. The initial read will contain the desired clock multiplier, which will be set up prior to any subsequent reads.

Table 2-14 SPI Device Configuration Field Descriptions

Bit	Field	Description
12-11	Mode	Clk Pol / Phase 0 = Data is output on the rising edge of SPICLK. Input data is latched on the falling edge. 1 = Data is output one half-cycle before the first rising edge of SPICLK and on subsequent falling edges. Input data is latched on the rising edge of SPICLK. 2 = Data is output on the falling edge of SPICLK. Input data is latched on the rising edge. 3 = Data is output one half-cycle before the first falling edge of SPICLK and on subsequent rising edges. Input data is latched on the falling edge of SPICLK.
10	4, 5 Pin	SPI operation mode configuration 0 = 4-pin mode used 1 = 5-pin mode used
9	Addr Width	SPI address width configuration 0 = 16-bit address values are used 1 = 24-bit address values are used
8-7	Chip Select	The chip select field value
6-3	Parameter Table Index	Specifies which parameter table is loaded
End of Table 2-14		

2.5.3 PLL Boot Configuration Settings

The PLL default settings are determined by the BOOTMODE[12:10] bits. The following table shows settings for various input clock frequencies.

Table 2-15 C66x DSP System PLL Configuration ⁽¹⁾

BOOTMODE [12:10]	Input Clock Freq (MHz)	850 MHz Device		
		PLLD	PLLM	DSP <i>f</i>
0b000	50.00	0	33	850
0b001	66.67	1	50	850.04
0b010	80.00	3	84	850
0b011	100.00	0	16	850
0b100	156.25	49	543	850
0b101	250.00	4	33	850
0b110	312.50	49	271	850
0b111	122.88	5	82	849.92
End of Table 2-15				

¹ The PLL boot configuration table above may not include all the frequency values that the device supports.

OUTPUT_DIVIDE is the value of the field of SECCTL[22:19]. This will set the PLL to the maximum clock setting for the device (with OUTPUT_DIVIDE=2, by default).

$$CLK = CLKIN \times (PLLM+1) \div (OUTPUT_DIVIDE \times (PLLD+1))$$

The Main PLL is controlled using a PLL controller and a chip-level MMR. The DDR3 PLL is controlled by chip level MMRs. For details on how to set up the PLL see section 7.5 “[Main PLL and PLL Controller](#)” on page 126. For details on the operation of the PLL controller module, see the *Phase Locked Loop (PLL) Controller for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

2.6 Second-Level Bootloaders

Any of the boot modes can be used to download a second-level bootloader. A second-level bootloader allows for any level of customization to current boot methods as well as the definition of a completely customized boot.

2.7 Terminals

2.7.1 Package Terminals

Figure 2-13 shows the TMS320C6654CZH and GZH ball grid area (BGA) packages (bottom view).

Figure 2-13 CZH/GZH 625-Pin BGA Package (Bottom View)

2.7.2 Pin Map

Figure 2-15 through Figure 2-18 show the TMS320C6654 pin assignments in four quadrants (A, B, C, and D).

2.8 Terminal Functions

The terminal functions table (Table 2-17) identifies the external signal names, the associated pin (ball) numbers, the pin type (I, O/Z, or I/O/Z), whether the pin has any internal pullup/pulldown resistors, and gives functional pin descriptions. This table is arranged by function. The power terminal functions table (Table 2-18) lists the various power supply pins and ground pins and gives functional pin descriptions. Table 2-19 shows all pins arranged by signal name. Table 2-20 shows all pins arranged by ball number.

There are 73 pins that have a secondary function as well as a primary function. The secondary function is indicated with a dagger (†). There is one pin that has a tertiary function as well as primary and secondary functions. The tertiary function is indicated with a double dagger (‡).

For more detailed information on device configuration, peripheral selection, multiplexed/shared pins, and pullup/pulldown resistors, see section 3.4 “Pullup/Pulldown Resistors” on page 86.

Use the symbol definitions in Table 2-16 when reading Table 2-17.

Table 2-16 I/O Functional Symbol Definitions

Functional Symbol	Definition	Table 2-17 Column Heading
IPD or IPU	Internal 100- μ A pulldown or pullup is provided for this terminal. In most systems, a 1-k Ω resistor can be used to oppose the IPD/IPU. For more detailed information on pulldown/pullup resistors and situations in which external pulldown/pullup resistors are required, see <i>Hardware Design Guide for KeyStone Devices</i> in “Related Documentation from Texas Instruments” on page 64.	IPD/IPU
A	Analog signal	Type
GND	Ground	Type
I	Input terminal	Type
O	Output terminal	Type
S	Supply voltage	Type
Z	Three-state terminal or high impedance	Type
End of Table 2-16

2.9 Development and Support

2.9.1 Development Support

In case the customer would like to develop their own features and software on the C6654 device, TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of C6000™ DSP-based applications:

- **Software Development Tools:**
 - Code Composer Studio™ Integrated Development Environment (IDE), including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools.
 - Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DSP application.
- **Hardware Development Tools:**
 - Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug)
 - EVM (Evaluation Module)

2.9.2 Device Support

2.9.2.1 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., TMX320CMH). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

- **TMX:** Experimental device that is not necessarily representative of the final device's electrical specifications
- **TMP:** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
- **TMS:** Fully qualified production device

Support tool development evolutionary flow:

- **TMDX:** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- **TMDS:** Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped with the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

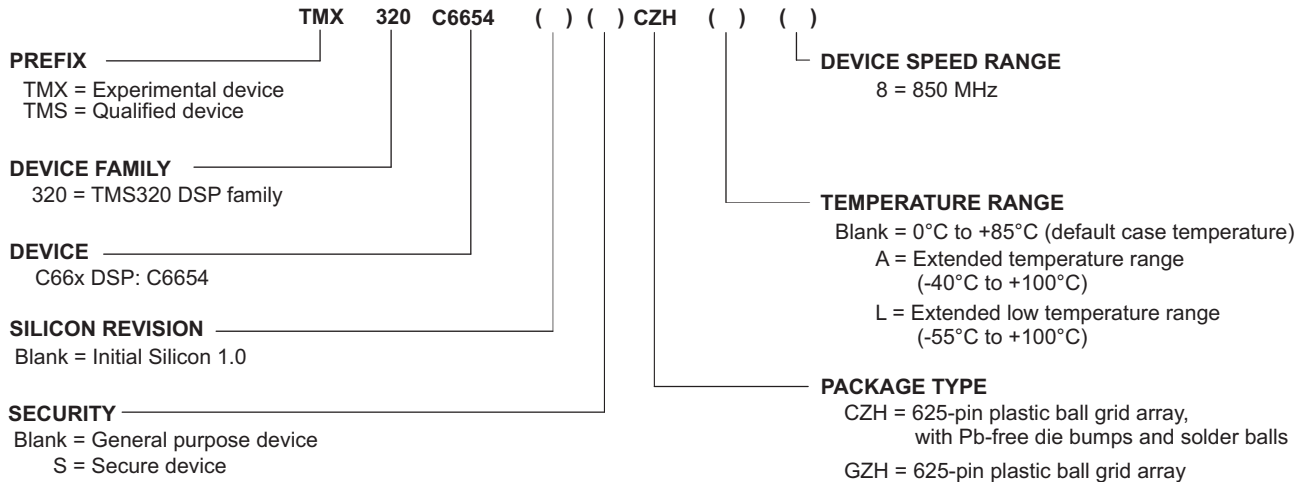

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, CZH), the temperature range (for example, blank is the default case temperature range), and the device speed range, in Megahertz (for example, blank is 1000 MHz [1 GHz]).

For device part numbers and further ordering information for TMS320C6654 in the CZH or GZH package type, see the TI website www.ti.com or contact your TI sales representative.

Figure 2-19 provides a legend for reading the complete device name for any C66x KeyStone device.

3 Device Configuration

On the TMS320C6654 device, certain device configurations like boot mode and endianness, are selected at device power-on reset. The status of the peripherals (enabled/disabled) is determined after device power-on reset.

3.1 Device Configuration at Device Reset

Table 3-1 describes the device configuration pins. The logic level is latched at power-on reset to determine the device configuration. The logic level on the device configuration pins can be set by using external pullup/pulldown resistors or by using some control device (e.g., FPGA/CPLD) to intelligently drive these pins. When using a control device, care should be taken to ensure there is no contention on the lines when the device is out of reset. The device configuration pins are sampled during power-on reset and are driven after the reset is removed. To avoid contention, the control device must stop driving the device configuration pins of the DSP. And when driving by a control device, the control device must be fully powered and out of reset itself and driving the pins before the DSP can be taken out of reset.

Also, please note that most of the device configuration pins are shared with other function pins (LENDIAN/GPIO[0], BOOTMODE[12:0]/GPIO[13:1], PCIESSMODE[1:0]/GPIO[15:14] and PCIESSSEN/TIMIO), some time must be given following the rising edge of reset in order to drive these device configuration input pins before they assume an output state (those GPIO pins should not become outputs during boot). Another caution that needs to be noted is that systems using TIMIO (pin shared with PCIESSSEN) as a clock input must assure that the clock itself is disabled from the input until after reset is released and a control device is no longer driving that input.

Note—If a configuration pin must be routed out from the device and it is not driven (Hi-Z state), the internal pullup/pulldown (IPU/IPD) resistor should not be relied upon. TI recommends the use of an external pullup/pulldown resistor. For more detailed information on pullup/pulldown resistors and situations in which external pullup/pulldown resistors are required, see Section 3.4 “Pullup/Pulldown Resistors” on page 86.

Table 3-1 TMS320C6654 Device Configuration Pins

Configuration Pin	Pin No.	IPD/IPU ⁽¹⁾	Functional Description
LENDIAN ^{(1) (2)}	T25	IPU	Device endian mode (LENDIAN). 0 = Device operates in big endian mode 1 = Device operates in little endian mode
BOOTMODE[12:0] ^{(1) (2)}	R25, R3, U25, T23, U24, T22, R21, U22, U23, V23, U21, T21, V22	IPD	Method of boot. Some pins may not be used by bootloader and can be used as general purpose config pins. Refer to the <i>Bootloader for the C66x DSP User Guide</i> in “Related Documentation from Texas Instruments” on page 64 for how to determine the device enumeration ID value.
PCIESSMODE[1:0] ^{(1) (2)}	W21, V21	IPD	PCIe Subsystem mode selection. 00 = PCIe in end point mode 01 = PCIe legacy end point (support for legacy INTx) 10 = PCIe in root complex mode 11 = Reserved
PCIESSSEN ^{(1) (2)}	AD20	IPD	PCIe subsystem enable/disable. 0 = PCIE Subsystem is disabled 1 = PCIE Subsystem is enabled

End of Table 3-1

1 Internal 100- μ A pulldown or pullup is provided for this terminal. In most systems, a 1-k Ω resistor can be used to oppose the IPD/IPU. For more detailed information on pulldown/pullup resistors and situations in which external pulldown/pullup resistors are required, see Section 3.4 “Pullup/Pulldown Resistors” on page 86.

2 These signal names are the secondary functions of these pins.

3.2 Peripheral Selection After Device Reset

Several of the peripherals on the TMS320C6654 are controlled by the Power Sleep Controller (PSC). By default, the PCIe is held in reset and clock-gated. The memory in this module is also in a low-leakage sleep mode. Software is required to turn this memory on. The software enables the module (turns on clocks and de-asserts reset) before this module can be used.

If one of the above modules is used in the selected ROM boot mode, the ROM code will automatically enable the module.

All other modules come up enabled by default and there is no special software sequence to enable. For more detailed information on the PSC usage, see the *Power Sleep Controller (PSC) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

3.3 Device State Control Registers

The TMS320C6654 device has a set of registers that are used to provide the status or configure certain parts of its peripherals. These registers are shown in [Table 3-2](#).

3.3.1 Device Status Register

The Device Status Register depicts the device configuration selected upon a power-on reset by either the $\overline{\text{POR}}$ or $\overline{\text{RESETFULL}}$ pin. Once set, these bits will remain set until the next power-on reset. The Device Status Register is shown in Figure 3-1 and described in Table 3-3.

Figure 3-1 Device Status Register

31	17	16	15	14	13	1	0
Reserved		PCIESSEN	PCIESSMODE[1:0]	BOOTMODE[12:0]		LENDIAN	
R-0		R-x	R/W-xx	R/W-xxxxxxxxxxxx		R-x ⁽¹⁾	

Legend: R = Read only; RW = Read/Write; -n = value after reset

1 x indicates the bootstrap value latched via the external pin

Table 3-3 Device Status Register Field Descriptions

Bit	Field	Description
31-17	Reserved	Reserved. Read only, writes have no effect.
16	PCIESSEN	PCIe module enable 0 = PCIe module disabled 1 = PCIe module enabled
15-14	PCIESSMODE[1:0]	PCIe Mode selection pins 00b = PCIe in End-point mode 01b = PCIe in Legacy End-point mode (support for legacy INTx) 10b = PCIe in Root complex mode 11b = Reserved
13-1	BOOTMODE[12:0]	Determines the bootmode configured for the device. For more information on bootmode, refer to Section 2.5 “Boot Modes Supported and PLL Settings” on page 25 and see the <i>Bootloader for the C66x DSP User Guide</i> in 2.10 “Related Documentation from Texas Instruments” on page 64
0	LENDIAN	Device Endian mode (LENDIAN) — Shows the status of whether the system is operating in Big Endian mode or Little Endian mode. 0 = System is operating in Big Endian mode 1 = System is operating in Little Endian mode
End of Table 3-3		

3.3.2 Device Configuration Register

The Device Configuration Register is one-time writeable through software. The register is reset on all hard resets and is locked after the first write. The Device Configuration Register is shown in [Figure 3-2](#) and described in [Table 3-4](#).

Figure 3-2 Device Configuration Register (DEVCFG)

Legend: R = Read only; RW = Read/Write; -n = value after reset

Table 3-4 Device Configuration Register Field Descriptions

Bit	Field	Description
31-1	Reserved	Reserved. Read only, writes have no effect.
0	SYSCLKOUTEN	SYSCLKOUT Enable 0 = No clock output 1 = Clock output enabled (default)
End of Table 3-4		

3.3.3 JTAG ID (JTAGID) Register Description

The JTAG ID register is a read-only register that identifies to the customer the JTAG/Device ID. For the device, the JTAG ID register resides at address location 0x0262 0018. The JTAG ID Register is shown in [Figure 3-3](#) and described in [Table 3-5](#).

Figure 3-3 JTAG ID (JTAGID) Register

31	28	27	12	11	1	0	
VARIANT		PART NUMBER			MANUFACTURER		LSB
R-xxxxb		R-1011 1001 0111 1010b			0000 0010 111b		R-1

Legend: RW = Read/Write; R = Read only; -n = value after reset

Table 3-5 JTAG ID Register Field Descriptions

Bit	Field	Value	Description
31-28	VARIANT	xxxxb	Variant (4-Bit) value.
27-12	PART NUMBER	1011 1001 0111 1010b	Part Number for boundary scan
11-1	MANUFACTURER	0000 0010 111b	Manufacturer
0	LSB	1b	This bit is read as a 1 for TMS320C6654
End of Table 3-5			

Note—The value of the VARIANT and PART NUMBER fields depend on the silicon revision. See the Silicon Errata for details.

3.3.4 Kicker Mechanism (KICK0 and KICK1) Register

The Bootcfg module contains a kicker mechanism to prevent any spurious writes from changing any of the Bootcfg MMR values. When the kicker is locked (which it is initially after power on reset), none of the Bootcfg MMRs are writable (they are only readable). On the C6654, the exception to this are the IPC registers such as IPCGRx and IPCARx. These registers are not protected by the kicker mechanism. This mechanism requires two MMR writes to the KICK0 and KICK1 registers with exact data values before the kicker lock mechanism is un-locked. See [Table 3-2 “Device State Control Registers”](#) on page 66 for the address location. Once released, then all the Bootcfg MMRs having write permissions are writable (the read only MMRs are still read only). The first KICK0 data is 0x83e70b13. The second KICK1 data is 0x95a4f1e0. Writing any other data value to either of these kick MMRs will lock the kicker mechanism and block any writes to Bootcfg MMRs. To ensure protection of all Bootcfg MMRs, software must always re-lock the kicker mechanism after completing the MMR writes.

3.3.5 LRESETNMI PIN Status (LRSTNMIPINSTAT) Register

The LRSTNMIPINSTAT Register is created in Boot Configuration to latch the status of $\overline{\text{LRESET}}$ and $\overline{\text{NMI}}$ based on CORESEL. The LRESETNMI PIN Status Register is shown and described in the following tables.

Figure 3-4 LRESETNMI PIN Status Register (LRSTNMIPINSTAT)

31	18	17	16	15	2	1	0
Reserved		Reserved	NMIO	Reserved		Reserved	LRO
R, +0000 0000		R-0	R-0	R, +0000 0000		R-0	R-0

Legend: R = Read only; -n = value after reset;

Table 3-6 LRESETNMI PIN Status Register (LRSTNMIPINSTAT) Field Descriptions

Bit	Field	Description
31-18	Reserved	Reserved
17	Reserved	Reserved
16	NMIO	CorePac0 in NMI
15-2	Reserved	Reserved
1	Reserved	Reserved
0	LRO	CorePac0 in Local Reset
End of Table 3-6		

3.3.6 LRESETNMI PIN Status Clear (LRSTNMIPINSTAT_CLR) Register

The LRSTNMIPINSTAT_CLR Register is used to clear the status of $\overline{\text{LRESET}}$ and $\overline{\text{NMI}}$ based on CORESEL. The LRESETNMI PIN Status Clear Register is shown and described in the following tables.

Figure 3-5 LRESETNMI PIN Status Clear Register (LRSTNMIPINSTAT_CLR)

31	18	17	16	15	2	1	0
Reserved		Reserved	NMIO	Reserved		Reserved	LRO
R, +0000 0000		WC,+0	WC,+0	R, +0000 0000		WC,+0	WC,+0

Legend: R = Read only; -n = value after reset; WC = Write 1 to Clear

Table 3-7 LRESETNMI PIN Status Clear Register (LRSTNMIPINSTAT_CLR) Field Descriptions

Bit	Field	Description
31-18	Reserved	Reserved
17	Reserved	Reserved
16	NMIO	CorePac0 in NMI Clear
15-2	Reserved	Reserved
1	Reserved	Reserved
0	LRO	CorePac0 in Local Reset Clear
End of Table 3-7		

3.3.7 Reset Status (RESET_STAT) Register

The reset status register (RESET_STAT) captures the status of Local reset (LRx) for each of the cores and also the global device reset (GR). Software can use this information to take different device initialization steps, if desired.

- In case of Local reset: The LRx bits are written as 1 and GR bit is written as 0 only when the CorePac receives an local reset without receiving a global reset.
- In case of Global reset: The LRx bits are written as 0 and GR bit is written as 1 only when a global reset is asserted.

The Reset Status Register is shown and described in the following tables.

Figure 3-6 Reset Status Register (RESET_STAT)

31	30	2	1	0
GR	Reserved		Reserved	LR0
R, +1	R, + 000 0000 0000 0000 0000 0000		R,+0	R,+0

Legend: R = Read only; -n = value after reset

Table 3-8 Reset Status Register (RESET_STAT) Field Descriptions

Bit	Field	Description
31	GR	Global reset status 0 = Device has not received a global reset. 1 = Device received a global reset.
30-2	Reserved	Reserved.
1	Reserved	Reserved.
0	LR0	CorePac0 reset status 0 = CorePac0 has not received a local reset. 1 = CorePac0 received a local reset.
End of Table 3-8		

3.3.8 Reset Status Clear (RESET_STAT_CLR) Register

The RESET_STAT bits can be cleared by writing 1 to the corresponding bit in the RESET_STAT_CLR register. The Reset Status Clear Register is shown and described in the following tables.

Figure 3-7 Reset Status Clear Register (RESET_STAT_CLR)

31	30	2	1	0
GR	Reserved		Reserved	LR0
RW, +0	R, + 000 0000 0000 0000 0000 0000		RW,+0	RW,+0

Legend: R = Read only; RW = Read/Write; -n = value after reset

Table 3-9 Reset Status Clear Register (RESET_STAT_CLR) Field Descriptions

Bit	Field	Description
31	GR	Global reset clear bit 0 = Writing a 0 has no effect. 1 = Writing a 1 to the GR bit clears the corresponding bit in the RESET_STAT register.
30-2	Reserved	Reserved.
1	Reserved	Reserved.
0	LR0	CorePac0 reset clear bit 0 = Writing a 0 has no effect. 1 = Writing a 1 to the LR0 bit clears the corresponding bit in the RESET_STAT register.
End of Table 3-9		

3.3.9 Boot Complete (BOOTCOMPLETE) Register

The BOOTCOMPLETE register controls the BOOTCOMPLETE pin status. The purpose is to indicate the completion of the ROM booting process. The Boot Complete Register is shown and described in the following tables.

Figure 3-8 Boot Complete Register (BOOTCOMPLETE)

31	2	1	0
Reserved		Reserved	BC0
R, + 0000 0000 0000 0000 0000 0000		RW,+0	RW,+0

Legend: R = Read only; RW = Read/Write; -n = value after reset

Table 3-10 Boot Complete Register (BOOTCOMPLETE) Field Descriptions

Bit	Field	Description
31-2	Reserved	Reserved.
1	Reserved	Reserved
0	BC0	CorePac0 boot status 0 = CorePac0 boot NOT complete 1 = CorePac0 boot complete
End of Table 3-10		

The BCx bit indicates the boot complete status of the corresponding core. All BCx bits will be sticky bits — that is they can be set only once by the software after device reset and they will be cleared to 0 on all device resets.

Boot ROM code will be implemented such that each core will set its corresponding BCx bit immediately before branching to the predefined location in memory.

3.3.10 Power State Control (PWRSTATECTL) Register

The PWRSTATECTL register is controlled by the software to indicate the power-saving mode. ROM code reads this register to differentiate between the various power saving modes. This register is cleared only by POR and will survive all other device resets. See the *Hardware Design Guide for KeyStone Devices* in “[Related Documentation from Texas Instruments](#)” on page 64 for more information. The Power State Control Register is shown in [Figure 3-9](#) and described in [Table 3-11](#).

Figure 3-9 Power State Control Register (PWRSTATECTL)

31	3	2	1	0
GENERAL_PURPOSE		HIBERNATION_MODE	HIBERNATION	STANDBY
RW, +0000 0000 0000 0000 0000 0000 0000 0		RW,+0	RW,+0	RW,+0

Legend: RW = Read/Write; -n = value after reset

Table 3-11 Power State Control Register (PWRSTATECTL) Field Descriptions

Bit	Field	Description
31-3	GENERAL_PURPOSE	Used to provide a start address for execution out of the hibernation modes. See the Bootloader for the <i>C66x DSP User Guide</i> in “ Related Documentation from Texas Instruments ” on page 64.
2	HIBERNATION_MODE	Indicates whether the device is in hibernation mode 1 or mode 2. 0 = Hibernation mode 1 1 = Hibernation mode 2
1	HIBERNATION	Indicates whether the device is in hibernation mode or not. 0 = Not in hibernation mode 1 = Hibernation mode
0	STANDBY	Indicates whether the device is in standby mode or not. 0 = Not in standby mode 1 = Standby mode
End of Table 3-11		

3.3.11 NMI Event Generation to CorePac (NMIGRx) Register

NMIGRx registers are used for generating NMI events to the CorePac. The C6654 has only NMIGR0, which generates an NMI event to the CorePac. Writing a 1 to the NMIG field generates an NMI pulse. Writing a 0 has no effect and reads return 0 and have no other effect. The NMI Event Generation to CorePac Register is shown in [Figure 3-10](#) and described in [Table 3-12](#).

Figure 3-10 NMI Generation Register (NMIGRx)

31	1	0
Reserved		NMIG
R, +0000 0000 0000 0000 0000 0000 0000 000		RW,+0

Legend: RW = Read/Write; -n = value after reset

Table 3-12 NMI Generation Register (NMIGRx) Field Descriptions

Bit	Field	Description
31-1	Reserved	Reserved
0	NMIG	NMI pulse generation. Reads return 0 Writes: 0 = No effect 1 = Sends an NMI pulse to the CorePac
End of Table 3-12		

3.3.12 IPC Generation (IPCGRx) Registers

IPCGRx are the IPC interrupt generation registers to facilitate inter CorePac interrupts.

The C6654 has only IPCGR0. This register can be used by external hosts to generate interrupts to the CorePac. A write of 1 to the IPCG field of the IPCGRx register will generate an interrupt pulse to the CorePac.

This register also provides a *Source ID* facility by which up to 28 different sources of interrupts can be identified. Allocation of source bits to source processor and meaning is entirely based on software convention. The register field descriptions are given in the following tables. Virtually anything can be a source for these registers as this is completely controlled by software. Any master that has access to BOOTCFG module space can write to these registers. The IPC Generation Register is shown in [Figure 3-11](#) and described in [Table 3-13](#).

Figure 3-11 IPC Generation Registers (IPCGRx)

31	30	29	28	27	8	7	6	5	4	3	1	0
SRCS27	SRCS26	SRCS25	SRCS24	SRCS23 – SRCS4	SRCS3	SRCS2	SRCS1	SRCS0	Reserved	Reserved	Reserved	IPCG

Legend: R = Read only; RW = Read/Write; -n = value after reset

Table 3-13 IPC Generation Registers (IPCGRx) Field Descriptions

Bit	Field	Description
31-4	SRCSx	Interrupt source indication. Reads return current value of internal register bit. Writes: 0 = No effect 1 = Sets both SRCSx and the corresponding SRCCx.
3-1	Reserved	Reserved
0	IPCG	Inter-DSP interrupt generation. Reads return 0. Writes: 0 = No effect 1 = Creates an Inter-DSP interrupt.
End of Table 3-13		

3.3.13 IPC Acknowledgement (IPCARx) Registers

IPCARx are the IPC interrupt-acknowledgement registers to facilitate inter-CorePac core interrupts.

The C6654 has only IPCAR0. This register also provides a *Source ID* facility by which up to 28 different sources of interrupts can be identified. Allocation of source bits to source processor and meaning is entirely based on software convention. The register field descriptions are shown in the following tables. Virtually anything can be a source for these registers as this is completely controlled by software. Any master that has access to BOOTCFG module space can write to these registers. The IPC Acknowledgement Register is shown in [Figure 3-12](#) and described in [Table 3-14](#).

31-4	SRCCx	Interrupt source acknowledgement. Reads return current value of internal register bit. Writes: 0 = No effect 1 = Clears both SRCCx and the corresponding SRCSx
3-0	Reserved	Reserved
End of Table 3-14		

3.3.14 IPC Generation Host (IPCGRH) Register

IPCGRH register is provided to facilitate host DSP interrupt. Operation and use of IPCGRH is the same as other IPCGR registers. Interrupt output pulse created by IPCGRH is driven on a device pin, host interrupt/event output (HOUT).

The host interrupt output pulse should be stretched. It should be asserted for 4 bootcfg clock cycles (CPU/6) followed by a deassertion of 4 bootcfg clock cycles. Generating the pulse will result in 8 CPU/6 cycle pulse blocking window. Write to IPCGRH with IPCG bit (bit 0) set will only generate a pulse if they are beyond 8 CPU/6 cycle period. The IPC Generation Host Register is shown in [Figure 3-13](#) and described in [Table 3-15](#).

Figure 3-13 IPC Generation Registers (IPCGRH)

End of Table 3-23		

3.4 Pullup/Pulldown Resistors

Proper board design should ensure that input pins to the device always be at a valid logic level and not floating. This may be achieved via pullup/pulldown resistors. The device features internal pullup (IPU) and internal pulldown (IPD) resistors on most pins to eliminate the need, unless otherwise noted, for external pullup/pulldown resistors.

An external pullup/pulldown resistor needs to be used in the following situations:

- **Device Configuration Pins:** If the pin is both routed out and are not driven (in Hi-Z state), an external pullup/pulldown resistor must be used, even if the IPU/IPD matches the desired value/state.
- **Other Input Pins:** If the IPU/IPD does not match the desired value/state, use an external pullup/pulldown resistor to pull the signal to the opposite rail.

For the device configuration pins (listed in [Table 3-1](#)), if they are both routed out and are not driven (in Hi-Z state), it is strongly recommended that an external pullup/pulldown resistor be implemented. Although, internal pullup/pulldown resistors exist on these pins and they may match the desired configuration value, providing external connectivity can help ensure that valid logic levels are latched on these device configuration pins. In addition, applying external pullup/pulldown resistors on the device configuration pins adds convenience to the user in debugging and flexibility in switching operating modes.

Tips for choosing an external pullup/pulldown resistor:

- Consider the total amount of current that may pass through the pullup or pulldown resistor. Make sure to include the leakage currents of all the devices connected to the net, as well as any internal pullup or pulldown resistors.
- Decide a target value for the net. For a pulldown resistor, this should be below the lowest V_{IL} level of all inputs connected to the net. For a pullup resistor, this should be above the highest V_{IH} level of all inputs on the net. A reasonable choice would be to target the V_{OL} or V_{OH} levels for the logic family of the limiting device; which, by definition, have margin to the V_{IL} and V_{IH} levels.
- Select a pullup/pulldown resistor with the largest possible value that can still ensure that the net will reach the target pulled value when maximum current from all devices on the net is flowing through the resistor. The current to be considered includes leakage current plus, any other internal and external pullup/pulldown resistors on the net.
- For bidirectional nets, there is an additional consideration that sets a lower limit on the resistance value of the external resistor. Verify that the resistance is small enough that the weakest output buffer can drive the net to the opposite logic level (including margin).
- Remember to include tolerances when selecting the resistor value.
- For pullup resistors, also remember to include tolerances on the DV_{DD} rail.

For most systems:

- A 1-k Ω resistor can be used to oppose the IPU/IPD while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.
- A 20-k Ω resistor can be used to compliment the IPU/IPD on the device configuration pins while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For more detailed information on input current (I_I), and the low-level/high-level input voltages (V_{IL} and V_{IH}) for the TMS320C6654 device, see Section 6.3 “[Electrical Characteristics](#)” on page 105.

To determine which pins on the device include internal pullup/pulldown resistors, see Table 2-17 “[Terminal Functions — Signals and Control by Function](#)” on page 38.

4 System Interconnect

On the TMS320C6654 device, the C66x CorePac, the EDMA3 transfer controller, and the system peripherals are interconnected through the TeraNet, which is a non-blocking switch fabric enabling fast and contention-free internal data movement. The TeraNet allows for low-latency, concurrent data transfers between master peripherals and slave peripherals. The TeraNet also allows for seamless arbitration between the system masters when accessing system slaves.

4.1 Internal Buses and Switch Fabrics

Two types of buses exist in the device: data buses and configuration buses. Some peripherals have both a data bus and a configuration bus interface, while others have only one type of interface. Further, the bus interface width and speed varies from peripheral to peripheral. Configuration buses are mainly used to access the register space of a peripheral and the data buses are used mainly for data transfers.

The C66x CorePac, the EDMA3 traffic controller, and the various system peripherals can be classified into two categories: masters and slaves. Masters are capable of initiating read and write transfers in the system and do not rely on the EDMA3 for their data transfers. Slaves, on the other hand, rely on the masters to perform transfers to and from them. Examples of masters include the EDMA3 traffic controller and PCI Express. Examples of slaves include the SPI, UART, and I²C.

The masters and slaves in the device are communicating through the TeraNet (switch fabric). The device contains two switch fabrics. The data switch fabric (data TeraNet) and the configuration switch fabric (configuration TeraNet). The data TeraNet, is a high-throughput interconnect mainly used to move data across the system. The data TeraNet connects masters to slaves via data buses. The configuration TeraNet, is mainly used to access peripheral registers. The configuration TeraNet connects masters to slaves via configuration buses. Note that the data TeraNet also connects to the configuration TeraNet. For more details see 4.2 [“Switch Fabric Connections Matrix”](#) on page 88.

4.2 Switch Fabric Connections Matrix

The tables below list the master and slave end point connections.

Intersecting cells may contain one of the following:

- Y — There is a connection between this master and that slave.
- - — There is NO connection between this master and that slave.
- n — A numeric value indicates that the path between this master and that slave goes through bridge n.

Figure 4-4 TeraNet 3P_Tracer

Figure 4-5 TeraNet 6P_B

4.4 Bus Priorities

The priority level of all master peripheral traffic is defined at the TeraNet boundary. User programmable priority registers allow software configuration of the data traffic through the TeraNet. Note that a lower number means higher priority - PRI = 000b = urgent, PRI = 111b = low.

Most master ports provide their priority directly and do not need a default priority setting. Examples include the CorePacs, whose priorities are set through software in the UMC control registers. All the packet-DMA-based peripherals also have internal registers to define the priority level of their initiated transactions.

Some masters do not have a priority allocation register of their own. For these masters, a priority allocation register is provided for them and described in the sections below. For all other modules, see the respective User Guides in “[Related Documentation from Texas Instruments](#)” on page 64 for programmable priority registers.

4.4.1 Packet DMA Priority Allocation (PKTDMA_PRI_ALLOC) Register

The packet DMA secondary port is one master port that does not have priority allocation register inside the IP. The priority level for transaction from this master port is described by PKTDMA_PRI_ALLOC register in [Figure 4-6](#) and [Table 4-3](#).

Figure 4-6 Packet DMA Priority Allocation Register (PKTDMA_PRI_ALLOC)

Legend: R = Read only; R/W = Read/Write; -n = value after reset

Table 4-3 Packet DMA Priority Allocation Register (PKTDMA_PRI_ALLOC) Field Descriptions

Bit	Field	Description
31-3	Reserved	Reserved.
2-0	PKDTDMA_PRI	Control the priority level for the transactions from packet DMA master port, which access the external linking RAM.

End of Table 4-3

4.4.2 EMAC / uPP Priority Allocation (EMAC_UPP_PRI_ALLOC) Register

The EMAC and uPP are master ports that do not have priority allocation registers inside the IP. The priority level for transaction from these master ports is described by EMAC_UPP_PRI_ALLOC register in [Figure 4-7](#) and [Table 4-4](#).

Figure 4-7 EMAC / uPP Priority Allocation Register (EMAC_UPP_PRI_ALLOC)

End of Table 4-4		

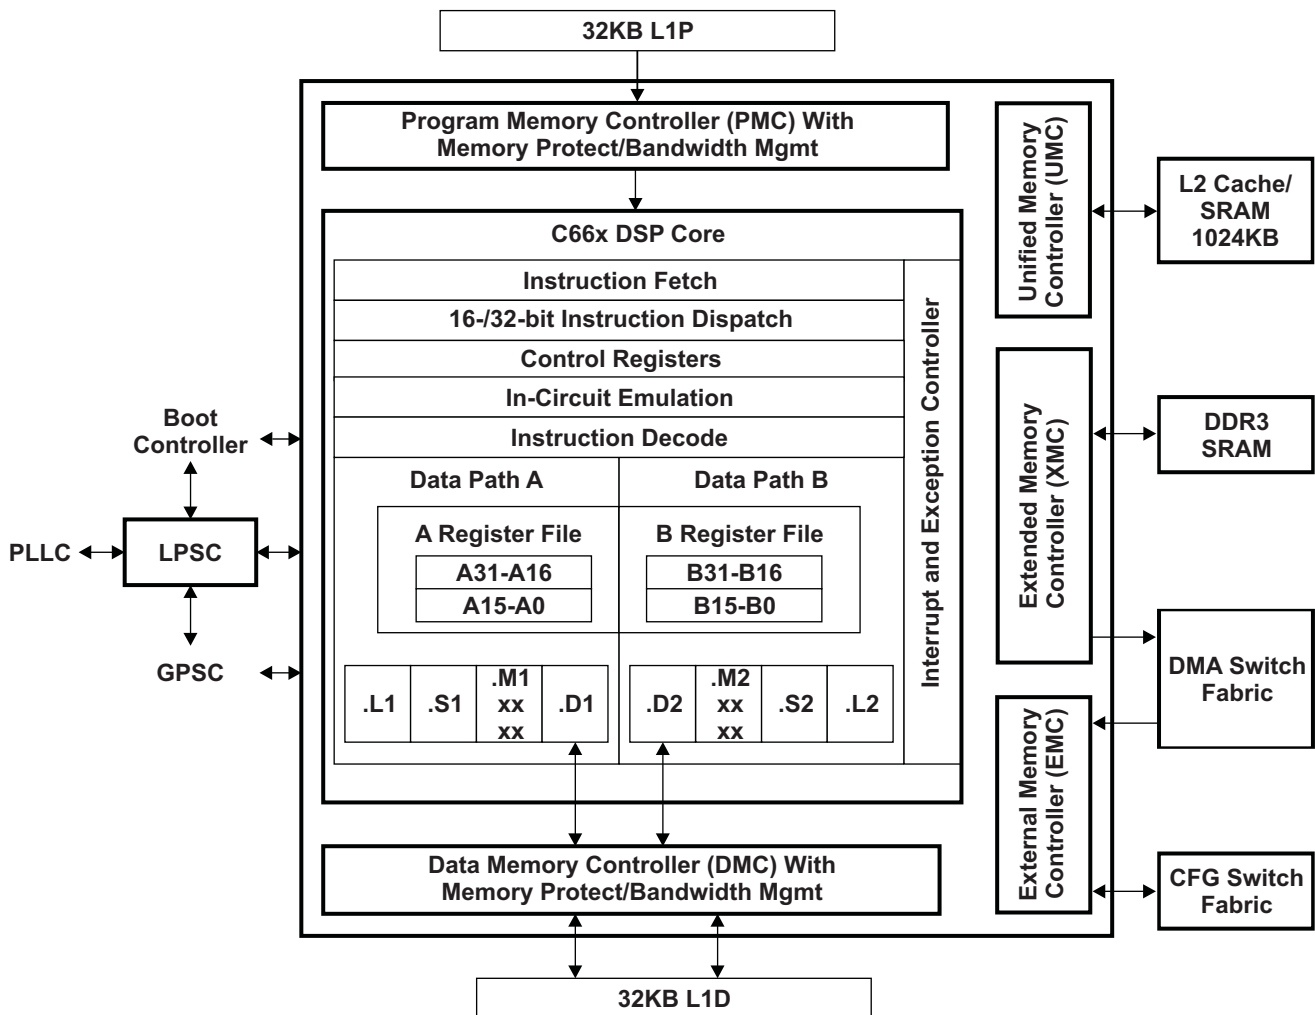

5 C66x CorePac

The C66x CorePac consists of several components:

- The C66x DSP and associated C66x CorePac core
- Level-one and level-two memories (L1P, L1D, L2)
- Data Trace Formatter (DTF)
- Embedded Trace Buffer (ETB)
- Interrupt Controller
- Power-down controller
- External Memory Controller
- Extended Memory Controller
- A dedicated power/sleep controller (LPSC)

The C66x CorePac also provides support for memory protection, bandwidth management (for resources local to the C66x CorePac) and address extension. [Figure 5-1](#) shows a block diagram of the C66x CorePac.

Figure 5-1 C66x CorePac Block Diagram

For more detailed information on the TMS320C66x CorePac on the C6654 device, see the *C66x CorePac User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

5.1 Memory Architecture

The C66x CorePac in the device contains a 1024KB level-2 memory (L2), a 32KB level-1 program memory (L1P), and a 32KB level-1 data memory (L1D). All memory on the C6654 has a unique location in the memory map (see Table 2-2 “Memory Map Summary” on page 21).

After device reset, L1P and L1D cache are configured as all cache, by default. The L1P and L1D cache can be reconfigured via software through the L1PMODE field of the L1P Configuration Register (L1PCFG) and the L1DMODE field of the L1D Configuration Register (L1DCFG) of the C66x CorePac. L1D is a two-way set-associative cache, while L1P is a direct-mapped cache.

The on-chip bootloader changes the reset configuration for L1P and L1D. For more information, see the *Bootloader for the C66x DSP User Guide* in “Related Documentation from Texas Instruments” on page 64.

For more information on the operation L1 and L2 caches, see the *C66x DSP Cache User Guide* in “Related Documentation from Texas Instruments” on page 64.

5.1.1 L1P Memory

The L1P memory configuration for the C6654 device is as follows:

- 32K bytes with no wait states

Figure 5-2 shows the available SRAM/cache configurations for L1P.

Figure 5-2 L1P Memory Configurations

5.1.2 L1D Memory

The L1D memory configuration for the C6654 device is as follows:

- 32K bytes with no wait states

Figure 5-3 shows the available SRAM/cache configurations for L1D.

Figure 5-3 L1D Memory Configurations

5.1.3 L2 Memory

The L2 memory configuration for the C6654 device is as follows:

- Total memory is 1024KB
- Each core contains 1024KB of memory
- Local starting address for each core is 0080 0000h

L2 memory can be configured as all SRAM, all 4-way set-associative cache, or a mix of the two. The amount of L2 memory that is configured as cache is controlled through the L2MODE field of the L2 Configuration Register (L2CFG) of the C66x CorePac. Figure 5-4 shows the available SRAM/cache configurations for L2. By default, L2 is configured as all SRAM after device reset.

Figure 5-4 L2 Memory Configurations

Global addresses are accessible to all masters in the system. In addition, local memory can be accessed directly by the associated processor through aliased addresses, where the eight MSBs are masked to zero. The aliasing is handled within the C66x CorePac and allows for common code to be run unmodified on multiple cores. For example, address location 0x10800000 is the global base address for C66x CorePac Core 0's L2 memory. C66x CorePac Core 0 can access this location by either using 0x10800000 or 0x00800000. Any other master on the device must use 0x10800000 only. Conversely, 0x00800000 can be used by any of the cores as their own L2 base addresses.

For C66x CorePac Core 0, address 0x00800000 is equivalent to 0x10800000. Local addresses should be used only for shared code or data, allowing a single image to be included in memory. Any code/data targeted to a specific core, or a memory region allocated during run-time by a particular core should always use the global address only.

5.1.4 MSM Controller

The MSM configuration for the device is as follows:

- Allows extension of external addresses from 2GB to up to 8GB
- Has built in memory protection features

For more details on external memory address extension and memory protection features, see the *Multicore Shared Memory Controller (MSMC) for KeyStone Devices User Guide* in [“Related Documentation from Texas Instruments”](#) on page 64.

5.1.5 L3 Memory

The L3 ROM on the device is 128KB. The ROM contains software used to boot the device. There is no requirement to block accesses from this portion to the ROM.

5.2 Memory Protection

Memory protection allows an operating system to define who or what is authorized to access L1D, L1P, and L2 memory. To accomplish this, the L1D, L1P, and L2 memories are divided into pages. There are 16 pages of L1P (2KB each), 16 pages of L1D (2KB each), and 32 pages of L2 (16KB each). The L1D, L1P, and L2 memory controllers in the C66x CorePac are equipped with a set of registers that specify the permissions for each memory page.

Each page may be assigned with fully orthogonal user and supervisor read, write, and execute permissions. In addition, a page may be marked as either (or both) locally accessible or globally accessible. A local access is a direct DSP access to L1D, L1P, and L2, while a global access is initiated by a DMA (either IDMA or the EDMA3) or by other system masters. Note that EDMA or IDMA transfers programmed by the DSP count as global accesses. On a secure device, pages can be restricted to secure access only (default) or opened up for public, non-secure access.

The DSP and each of the system masters on the device are all assigned a privilege ID. It is possible to specify whether memory pages are locally or globally accessible.

The AIDx and LOCAL bits of the memory protection page attribute registers specify the memory page protection scheme, see [Table 5-1](#).

Table 5-1 Available Memory Page Protection Schemes

AIDx Bit	Local Bit	Description
0	0	No access to memory page is permitted.
0	1	Only direct access by DSP is permitted.
1	0	Only accesses by system masters and IDMA are permitted (includes EDMA and IDMA accesses initiated by the DSP).
1	1	All accesses permitted.

End of Table 5-1

Faults are handled by software in an interrupt (or an exception, programmable within the C66x CorePac interrupt controller) service routine. A DSP or DMA access to a page without the proper permissions will:

- Block the access — reads return 0, writes are ignored
- Capture the initiator in a status register — ID, address, and access type are stored
- Signal event to DSP interrupt controller

The software is responsible for taking corrective action to respond to the event and resetting the error status in the memory controller. For more information on memory protection for L1D, L1P, and L2, see the *C66x CorePac User Guide* in [“Related Documentation from Texas Instruments”](#) on page 64.

5.3 Bandwidth Management

When multiple requestors contend for a single C66x CorePac resource, the conflict is resolved by granting access to the highest priority requestor. The following four resources are managed by the Bandwidth Management control hardware:

- Level 1 Program (L1P) SRAM/Cache
- Level 1 Data (L1D) SRAM/Cache
- Level 2 (L2) SRAM/Cache
- Memory-mapped registers configuration bus

The priority level for operations initiated within the C66x CorePac are declared through registers in the C66x CorePac. These operations are:

- DSP-initiated transfers
- User-programmed cache coherency operations
- IDMA-initiated transfers

The priority level for operations initiated outside the C66x CorePac by system peripherals is declared through the Priority Allocation Register (PRI_ALLOC), see section 4.4 “[Bus Priorities](#)” on page 94 for more details. System peripherals with no fields in the PRI_ALLOC have their own registers to program their priorities.

More information on the bandwidth management features of the C66x CorePac can be found in the *C66x CorePac User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

5.4 Power-Down Control

The C66x CorePac supports the ability to power down various parts of the C66x CorePac. The power down controller (PDC) of the C66x CorePac can be used to power down L1P, the cache control hardware, the DSP, and the entire C66x CorePac. These power-down features can be used to design systems for lower overall system power requirements.

Note—The C6654 does not support power-down modes for the L2 memory at this time.

More information on the power-down features of the C66x CorePac can be found in the *TMS320C66x CorePac Reference Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

5.5 C66x CorePac Revision

The version and revision of the C66x CorePac can be read from the CorePac Revision ID Register (MM_REVID) located at address 0181 2000h. The MM_REVID register is shown in [Figure 5-5](#) and described in [Table 5-2](#). The C66x CorePac revision is dependant on the silicon revision being used.

Figure 5-5 CorePac Revision ID Register (MM_REVID) Address - 0181 2000h

Legend: R = Read; -n = value after reset

Table 5-2 CorePac Revision ID Register (MM_REVID) Field Descriptions

Bit	Field	Description
31-16	VERSION	Version of the C66x CorePac implemented on the device.
15-0	REVISION	Revision of the C66x CorePac version implemented on the device.
End of Table 5-2		

5.6 C66x CorePac Register Descriptions

See the *C66x CorePac Reference Guide* in [“Related Documentation from Texas Instruments”](#) on page 64 for register offsets and definitions.

6 Device Operating Conditions

6.1 Absolute Maximum Ratings

**Table 6-1 Absolute Maximum Ratings⁽¹⁾
Over Operating Case Temperature Range (Unless Otherwise Noted)**

Supply voltage range ⁽²⁾ :	CVDD	-0.3 V to 1.3 V
	CVDD1	-0.3 V to 1.3 V
	DVDD15	-0.3 V to 2.45 V
	DVDD18	-0.3 V to 2.45 V
	VREFSSTL	$0.49 \times DVDD15$ to $0.51 \times DVDD15$
	VDDT1, VDDT2	-0.3 V to 1.3 V
	VDDR1, VDDR2, VDDR3, VDDR4	-0.3 V to 2.45 V
	AVDDA1, AVDDA2	-0.3 V to 2.45 V
	VSS Ground	0 V
Input voltage (V_I) range:	LVC MOS (1.8V)	-0.3 V to DVDD18+0.3 V
	DDR3	-0.3 V to 2.45 V
	I ² C	-0.3 V to 2.45 V
	LVDS	-0.3 V to DVDD18+0.3 V
	LJCB	-0.3 V to 1.3 V
	SerDes	-0.3 V to CVDD1+0.3 V
Output voltage (V_O) range:	LVC MOS (1.8V)	-0.3 V to DVDD18+0.3 V
	DDR3	-0.3 V to 2.45 V
	I ² C	-0.3 V to 2.45 V
	SerDes	-0.3 V to CVDD1+0.3 V
Operating case temperature range, T_C :	Commercial	0°C to 85°C
	Extended	-40°C to 100°C
ESD stress voltage, V_{ESD} ⁽³⁾ :	HBM (human body model) ⁽⁴⁾	±1000 V
	CDM (charged device model) ⁽⁵⁾	±250 V
Overshoot/undershoot ⁽⁶⁾	LVC MOS (1.8V)	20% Overshoot/Undershoot for 20% of Signal Duty Cycle
	DDR3	
	I ² C	
Storage temperature range, T_{stg} :		-65°C to 150°C
End of Table 6-1		

1 Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

2 All voltage values are with respect to V_{SS} .

3 Electrostatic discharge (ESD) to measure device sensitivity/immunity to damage caused by electrostatic discharges into the device.

4 Level listed above is the passing level per ANSI/ESDA/JEDEC JS-001-2010. JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process, and manufacturing with less than 500 V HBM is possible if necessary precautions are taken. Pins listed as 1000 V may actually have higher performance.

5 Level listed above is the passing level per EIA-JEDEC JESD22-C101E. JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process. Pins listed as 250 V may actually have higher performance.

6 Overshoot/Undershoot percentage relative to I/O operating values - for example the maximum overshoot value for 1.8-V LVC MOS signals is $DVDD18 + 0.20 \times DVDD18$ and maximum undershoot value would be $V_{SS} - 0.20 \times DVDD18$

6.2 Recommended Operating Conditions

Table 6-2 Recommended Operating Conditions^{(1) (2)}

			Min	Nom	Max	Unit
CVDD	SR Core Supply	850MHz - Device	SRVnom ⁽³⁾ × 0.95	0.85-1.1 ⁽⁴⁾	SRVnom × 1.05	V
CVDD1	Core supply voltage for memory array		0.95	1	1.05	V
DVDD18	1.8-V supply I/O voltage		1.71	1.8	1.89	V
DVDD15	1.5-V supply I/O voltage		1.425	1.5	1.575	V
VREFSSTL	DDR3 reference voltage		0.49 × DVDD15	0.5 × DVDD15	0.51 × DVDD15	V
V _{DDR_x} ⁽⁵⁾	SerDes regulator supply		1.425	1.5	1.575	V
V _{DDAx}	PLL analog supply		1.71	1.8	1.89	V
V _{DDTx}	SerDes termination supply		0.95	1	1.05	V
V _{SS}	Ground		0	0	0	V
V _{IH}	High-level input voltage	LVC MOS (1.8 V)	0.65 × DVDD18			V
		I ² C	0.7 × DVDD18			V
		DDR3 EMIF	VREFSSTL + 0.1			V
V _{IL}	Low-level input voltage	LVC MOS (1.8 V)			0.35 × DVDD18	V
		DDR3 EMIF	-0.3		VREFSSTL - 0.1	V
		I ² C			0.3 × DVDD18	V
T _C	Operating case temperature	Commercial	0		85	°C
		Extended	-40		100	°C

End of Table 6-2

1 All differential clock inputs comply with the LVDS Electrical Specification, IEEE 1596.3-1996 and all SERDES I/Os comply with the XAUI Electrical Specification, IEEE 802.3ae-2002.

2 All SERDES I/Os comply with the XAUI Electrical Specification, IEEE 802.3ae-2002.

3 SRVnom refers to the unique SmartReflex core supply voltage between 0.85 V and 1.1 V set from the factory for each individual device.

4 The initial CVDD voltage at power on will be 1.1V nominal and it must transition to VID set value immediately after being presented on VCNTL pins. This is required to maintain full power functionality and reliability targets guaranteed by TI.

5 Where x = 1, 2, 3, 4... to indicate all supplies of the same kind.

6.3 Electrical Characteristics

Table 6-3 Electrical Characteristics
Over Recommended Ranges of Supply Voltage and Operating Case Temperature (Unless Otherwise Noted)

Parameter		Test Conditions ⁽¹⁾	Min	Typ	Max	Unit
V _{OH} High-level output voltage	LVC MOS (1.8 V)	I _O = I _{OH}	DVDD18 - 0.45			V
	DDR3		DVDD15 - 0.4			
	I ² C ⁽²⁾					
V _{OL} Low-level output voltage	LVC MOS (1.8 V)	I _O = I _{OL}				V
	DDR3		0.45			
	I ² C	I _O = 3 mA, pulled up to 1.8 V	0.4			
I _I ⁽³⁾ Input current [DC]	LVC MOS (1.8 V)	No IPD/IPU	-5		5	μA
		Internal pullup	50	100	170 ⁽⁴⁾	
		Internal pulldown	-170	-100	-50	
	I ² C	0.1 × DVDD18 V < V _I < 0.9 × DVDD18 V	-10		10	
I _{OH} High-level output current [DC]	LVC MOS (1.8 V)					mA
	DDR3					
	I ² C ⁽⁵⁾					
I _{OL} Low-level output current [DC]	LVC MOS (1.8 V)					mA
	DDR3					
	I ² C					
I _{OZ} ⁽⁶⁾ Off-state output current [DC]	LVC MOS (1.8 V)		-2		2	μA
	DDR3		-2		2	
	I ² C		-2		2	

End of Table 6-3

1 For test conditions shown as MIN, MAX, or TYP, use the appropriate value specified in the recommended operating conditions table.

2 I²C uses open collector I/Os and does not have a V_{OH} Minimum.

3 I_I applies to input-only pins and bi-directional pins. For input-only pins, I_I indicates the input leakage current. For bi-directional pins, I_I includes input leakage current and off-state (Hi-Z) output leakage current.

4 For RESETSTAT, max DC input current is 300 μA.

5 I²C uses open collector I/Os and does not have a I_{OH} Maximum.

6 I_{OZ} applies to output-only pins, indicating off-state (Hi-Z) output leakage current.

6.4 Power Supply to Peripheral I/O Mapping

Table 6-4 Power Supply to Peripheral I/O Mapping ^{(1) (2)}
Over Recommended Ranges of Supply Voltage and Operating Case Temperature (Unless Otherwise Noted)

Power Supply		I/O Buffer Type	Associated Peripheral
CVDD	Supply Core Voltage	LJCB	CORECLK(P N) PLL input buffer
			SRIOSGMIICLK(P N) SerDes PLL input buffer
			DDRCLK(P N) PLL input buffer
			PCIECLK(P N) SERDES PLL input buffer
DVDD15	1.5-V supply I/O voltage	DDR3 (1.5 V)	All DDR3 memory controller peripheral I/O buffer
DVDD18	1.8-V supply I/O voltage	LVCMOS (1.8 V)	All GPIO peripheral I/O buffer
			All JTAG and EMU peripheral I/O buffer
			All Timer peripheral I/O buffer
			All SPI peripheral I/O buffer
			All RESETs, NMI, Control peripheral I/O buffer
			All SmartReflex peripheral I/O buffer
			All MDIO peripheral I/O buffer
			All UART peripheral I/O buffer
			All McBSP peripheral I/O buffer
		All EMIF16 peripheral I/O buffer	
		Open-drain (1.8V)	All I ² C peripheral I/O buffer
VDDT2	SGMII/PCIE SerDes termination and analogue front-end supply	SerDes/CML	SGMII/PCIE SerDes CML IO buffer
End of Table 6-4			

- 1 Please note that this table does not attempt to describe all functions of all power supply terminals but only those whose purpose it is to power peripheral I/O buffers and clock input buffers.
- 2 Please see the Hardware Design Guide for KeyStone Devices in [“Related Documentation from Texas Instruments”](#) on page 64 for more information about individual peripheral I/O.

7 Peripheral Information and Electrical Specifications

This chapter covers the various peripherals on the TMS320C6654 DSP. Peripheral-specific information, timing diagrams, electrical specifications, and register memory maps are described in this chapter.

7.1 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals *must* transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

7.2 Power Supplies

The following sections describe the proper power-supply sequencing and timing needed to properly power on the C6654. The various power supply rails and their primary function is listed in [Table 7-1](#).

Table 7-1 Power Supply Rails on TMS320C6654

Name	Primary Function	Voltage	Notes
CVDD	SmartReflex core supply voltage	0.85 V - 1.1 V	Includes core voltage for DDR3 module
CVDD1	Core supply voltage for memory array	1.0 V	Fixed supply at 1.0 V
VDDT1	Reserved	1.0 V	Connect to CVDD1
VDDT2	SGMII/PCIE SerDes termination supply	1.0 V	Filtered version of CVDD1. Special considerations for noise. Filter is not needed if SGMII/PCIE is not in use.
DVDD15	1.5-V DDR3 IO supply	1.5 V	
VDDR1	Reserved	1.5 V	Connect to DVDD15
VDDR2	PCIE SerDes regulator supply	1.5 V	Filtered version of DVDD15. Special considerations for noise. Filter is not needed if PCIE is not in use.
VDDR3	SGMII SerDes regulator supply	1.5 V	Filtered version of DVDD15. Special considerations for noise. Filter is not needed if SGMII is not in use.
VDDR4	Reserved	1.5 V	Connect to DVDD15
DVDD18	1.8-V IO supply	1.8V	
AVDDA1	Main PLL supply	1.8 V	Filtered version of DVDD18. Special considerations for noise.
AVDDA2	DDR3 PLL supply	1.8 V	Filtered version of DVDD18. Special considerations for noise.
VREFSSTL	0.75-V DDR3 reference voltage	0.75 V	Should track the 1.5-V supply. Use 1.5 V as source.
VSS	Ground	GND	

End of Table 7-1

7.2.1 Power-Supply Sequencing

This section defines the requirements for a power up sequencing from a power-on reset condition. There are two acceptable power sequences for the device. The first sequence stipulates the core voltages starting before the IO voltages as shown below.

1. CVDD
2. CVDD1, VDDT1-2
3. DVDD18, AVDDA1, AVDDA2
4. DVDD15, VDDR1-4

The second sequence provides compatibility with other TI processors with the IO voltage starting before the core voltages as shown below.

1. DVDD18, AVDDA1, AVDDA2
2. CVDD
3. CVDD1, VDDT1-2
4. DVDD15, VDDR1-4

The clock input buffers for CORECLK, DDRCLK, SRIOSGMIICLK, and PCIECLK use only CVDD as a supply voltage. These clock inputs are not failsafe and must be held in a high-impedance state until CVDD is at a valid voltage level. Driving these clock inputs high before CVDD is valid could cause damage to the device. Once CVDD is valid it is acceptable that the P and N legs of these CLKs may be held in a static state (either high and low or low and high) until a valid clock frequency is needed at that input. To avoid internal oscillation the clock inputs should be removed from the high impedance state shortly after CVDD is present.

If a clock input is not used it must be held in a static state. To accomplish this the N leg should be pulled to ground through a 1K ohm resistor. The P leg should be tied to CVDD to ensure it won't have any voltage present until CVDD is active. Connections to the IO cells powered by DVDD18 and DVDD15 are not failsafe and should not be driven high before these voltages are active. Driving these IO cells high before DVDD18 or DVDD15 are valid could cause damage to the device.

The device initialization is broken into two phases. The first phase consists of the time period from the activation of the first power supply until the point in which all supplies are active and at a valid voltage level. Either of the sequencing scenarios described above can be implemented during this phase. The figures below show both the core-before-IO voltage sequence and the IO-before-core voltage sequence. $\overline{\text{POR}}$ must be held low for the entire power stabilization phase.

This is followed by the device initialization phase. The rising edge of $\overline{\text{POR}}$ followed by the rising edge of $\overline{\text{RESETFULL}}$ will trigger the end of the initialization phase but both must be inactive for the initialization to complete. $\overline{\text{POR}}$ must always go inactive before $\overline{\text{RESETFULL}}$ goes inactive as described below. SYSCLK1 in the following section refers to the clock that is used by the CorePac, see [Figure 7-7](#) for more details.

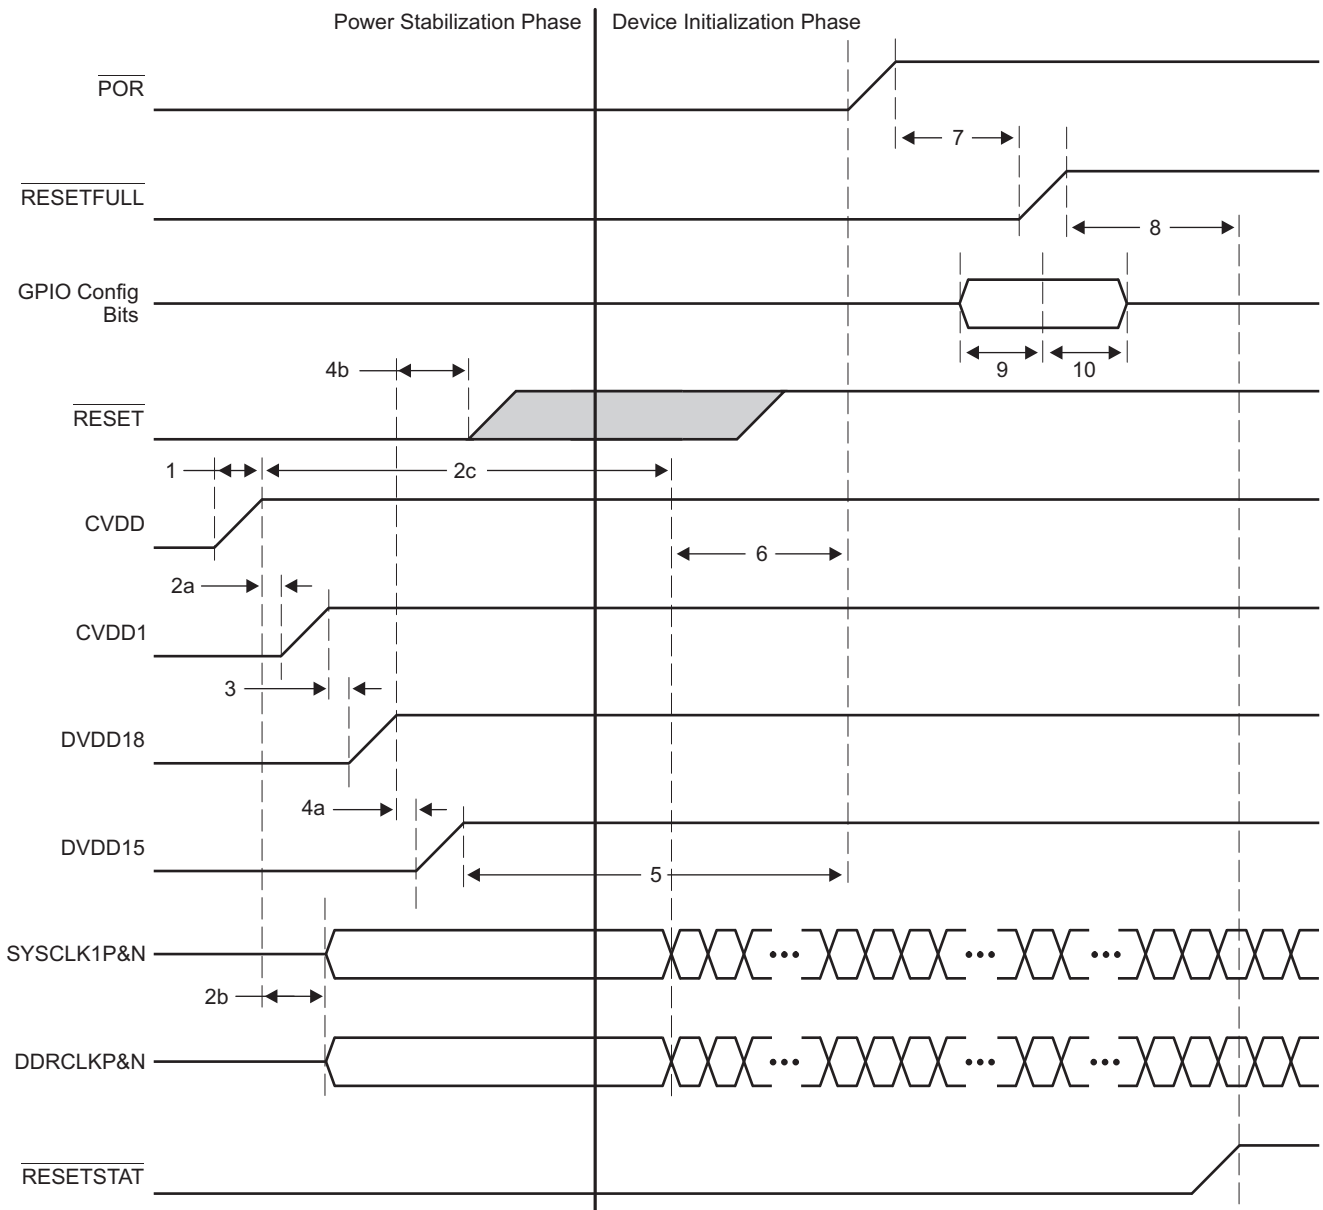

7.2.1.1 Core-Before-IO Power Sequencing

Figure 7-1 shows the power sequencing and reset control of TMS320C6654 for device initialization. $\overline{\text{POR}}$ may be removed after the power has been stable for the required 100 μsec . $\overline{\text{RESETFULL}}$ must be held low for a period after the rising edge of $\overline{\text{POR}}$ but may be held low for longer periods if necessary. The configuration bits shared with the GPIO pins will be latched on the rising edge of $\overline{\text{RESETFULL}}$ and must meet the setup and hold times specified. SYSCLK1 must always be active before $\overline{\text{POR}}$ can be removed. Core-before-IO power sequencing is defined in Table 7-2.

Note—TI recommends a maximum of 100 ms between one power rail being valid, and the next power rail in the sequence starting to ramp

Figure 7-1 Core Before IO Power Sequencing

TMS320C6654

Fixed and Floating-Point Digital Signal Processor

SPRS841A—August 2012

Table 7-2 Core Before IO Power Sequencing

Time	System State
1	<p>Begin Power Stabilization Phase</p> <ul style="list-style-type: none"> • CVDD (core AVS) ramps up. • $\overline{\text{POR}}$ must be held low through the power stabilization phase. Because $\overline{\text{POR}}$ is low, all the core logic that has async reset (created from $\overline{\text{POR}}$) is put into the reset state.
2a	<ul style="list-style-type: none"> • CVDD1 (core constant) ramps at the same time or shortly following CVDD. Although ramping CVDD1 and CVDD simultaneously is permitted, the voltage for CVDD1 must never exceed CVDD until after CVDD has reached a valid voltage. • The purpose of ramping up the core supplies close to each other is to reduce crowbar current. CVDD1 should trail CVDD as this will ensure that the WLs in the memories are turned off and there is no current through the memory bit cells. If, however, CVDD1 (core constant) ramps up before CVDD (core AVS), then the worst-case current could be on the order of twice the specified draw of CVDD1.
2b	<ul style="list-style-type: none"> • Once CVDD is valid, the clock drivers should be enabled. Although the clock inputs are not necessary at this time, they should either be driven with a valid clock or be held in a static state with one leg high and one leg low.
2c	<ul style="list-style-type: none"> • The DDRCLK and SYSCLK1 may begin to toggle anytime between when CVDD is at a valid level and the setup time before $\overline{\text{POR}}$ goes high specified by t_6.
3	<ul style="list-style-type: none"> • Filtered versions of 1.8 V can ramp simultaneously with DVDD18. • RESETSTAT is driven low once the DVDD18 supply is available. • All LVCMOS input and bidirectional pins must not be driven or pulled high until DVDD18 is present. Driving an input or bidirectional pin before DVDD18 is valid could cause damage to the device.
4a	<ul style="list-style-type: none"> • DVDD15 (1.5 V) supply is ramped up following DVDD18. Although ramping DVDD18 and DVDD15 simultaneously is permitted, the voltage for DVDD15 must never exceed DVDD18.
4b	<ul style="list-style-type: none"> • $\overline{\text{RESET}}$ may be driven high any time after DVDD18 is at a valid level. In a $\overline{\text{POR}}$-controlled boot, $\overline{\text{RESET}}$ must be high before $\overline{\text{POR}}$ is driven high.
5	<ul style="list-style-type: none"> • $\overline{\text{POR}}$ must continue to remain low for at least 100 μs after power has stabilized. <p>End Power Stabilization Phase</p>
6	<ul style="list-style-type: none"> • Device initialization requires 500 SYSCLK1 periods after the Power Stabilization Phase. The maximum clock period is 33.33 nsec, so a delay of an additional 16 μs is required before a rising edge of $\overline{\text{POR}}$. The clock must be active during the entire 16 μs.
7	<ul style="list-style-type: none"> • $\overline{\text{RESETFULL}}$ must be held low for at least 24 transitions of the SYSCLK1 after $\overline{\text{POR}}$ has stabilized at a high level.
8	<ul style="list-style-type: none"> • The rising edge of the $\overline{\text{RESETFULL}}$ will remove the reset to the efuse farm allowing the scan to begin. • Once device initialization and the efuse farm scan are complete, the $\overline{\text{RESETSTAT}}$ signal is driven high. This delay will be 10000 to 50000 clock cycles. <p>End Device Initialization Phase</p>
9	<ul style="list-style-type: none"> • GPIO configuration bits must be valid for at least 12 transitions of the SYSCLK1 before the rising edge of $\overline{\text{RESETFULL}}$
10	<ul style="list-style-type: none"> • GPIO configuration bits must be held valid for at least 12 transitions of the SYSCLK1 after the rising edge of $\overline{\text{RESETFULL}}$
End of Table 7-2	

7.2.1.2 IO-Before-Core Power Sequencing

The timing diagram for IO-before-core power sequencing is shown in Figure 7-2 and defined in Table 7-3.

Note—TI recommends a maximum of 100 ms between one power rail being valid, and the next power rail in the sequence starting to ramp.

Figure 7-2 IO Before Core Power Sequencing

Table 7-3 IO Before Core Power Sequencing

Time	System State
1	<p>Begin Power Stabilization Phase</p> <ul style="list-style-type: none"> • Because \overline{POR} is low, all the core logic having async reset (created from \overline{POR}) are put into reset state once the core supply ramps. \overline{POR} must remain low through Power Stabilization Phase. • Filtered versions of 1.8 V can ramp simultaneously with DVDD18. • $\overline{RESETSTAT}$ is driven low once the DVDD18 supply is available. • All input and bidirectional pins must not be driven or pulled high until DVDD18 is present. Driving an input or bidirectional pin before DVDD18 could cause damage to the device.
2a	<ul style="list-style-type: none"> • \overline{RESET} may be driven high anytime after DVDD18 is at a valid level.
2b	<ul style="list-style-type: none"> • CVDD (core AVS) ramps up.
3a	<ul style="list-style-type: none"> • CVDD1 (core constant) ramps at the same time or following CVDD. Although ramping CVDD1 and CVDD simultaneously is permitted the voltage for CVDD1 must never exceed CVDD until after CVDD has reached a valid voltage. • The purpose of ramping up the core supplies close to each other is to reduce crowbar current. CVDD1 should trail CVDD as this will ensure that the WLs in the memories are turned off and there is no current through the memory bit cells. If, however, CVDD1 (core constant) ramps up before CVDD (core AVS), then the worst case current could be on the order of twice the specified draw of CVDD1.
3b	<ul style="list-style-type: none"> • Once CVDD is valid, the clock drivers should be enabled. Although the clock inputs are not necessary at this time, they should either be driven with a valid clock or held in a static state with one leg high and one leg low.
3c	<ul style="list-style-type: none"> • The DDRCLK and SYSCLK1 may begin to toggle anytime between when CVDD is at a valid level and the setup time before \overline{POR} goes high specified by t6.
4	<ul style="list-style-type: none"> • DVDD15 (1.5 V) supply is ramped up following CVDD1.
5	<ul style="list-style-type: none"> • \overline{POR} must continue to remain low for at least 100 μs after power has stabilized. <p>End Power Stabilization Phase</p>
6	<p>Begin Device Initialization</p> <ul style="list-style-type: none"> • Device initialization requires 500 SYSCLK1 periods after the Power Stabilization Phase. The maximum clock period is 33.33 nsec so a delay of an additional 16 μs is required before a rising edge of \overline{POR}. The clock must be active during the entire 16 μs. • \overline{POR} must remain low.
7	<ul style="list-style-type: none"> • $\overline{RESETFULL}$ is held low for at least 24 transitions of the SYSCLK1 after \overline{POR} has stabilized at a high level. • The rising edge of the $\overline{RESETFULL}$ will remove the reset to the efuse farm allowing the scan to begin.
8	<ul style="list-style-type: none"> • Once device initialization and the efuse farm scan are complete, the $\overline{RESETSTAT}$ signal is driven high. This delay will be 10000 to 50000 clock cycles. <p>End Device Initialization Phase</p>
9	<ul style="list-style-type: none"> • GPIO configuration bits must be valid for at least 12 transitions of the SYSCLK1 before the rising edge of $\overline{RESETFULL}$
10	<ul style="list-style-type: none"> • GPIO configuration bits must be held valid for at least 12 transitions of the SYSCLK1 after the rising edge of $\overline{RESETFULL}$
End of Table 7-3	

7.2.1.3 Prolonged Resets

Holding the device in \overline{POR} , $\overline{RESETFULL}$, or \overline{RESET} for long periods of time will affect the long term reliability of the part. The device should not be held in a reset for times exceeding one hour and should not be held in reset for more the 5% of the time during which power is applied. Exceeding these limits will cause a gradual reduction in the reliability of the part. This can be avoided by allowing the DSP to boot and then configuring it to enter a hibernation state soon after power is applied. This will satisfy the reset requirement while limiting the power consumption of the device.

7.2.1.4 Clocking During Power Sequencing

Some of the clock inputs are required to be present for the device to initialize correctly, but behavior of many of the clocks is contingent on the state of the boot configuration pins. Table 7-4 describes the clock sequencing and the conditions that affect the clock operation. Note that all clock drivers should be in a high-impedance state until CVDD is at a valid level and that all clock inputs either be active or in a static state with one leg pulled low and the other connected to CVDD.

Table 7-4 Clock Sequencing

Clock	Condition	Sequencing
DDRCLK	None	Must be present 16 μ sec before $\overline{\text{POR}}$ transitions high.
CORECLK	None	CORECLK used to clock the core PLL. It must be present 16 μ sec before $\overline{\text{POR}}$ transitions high.
SRIOSGMIICLK	The SGMII port will be used.	SRIOSGMIICLK must be present 16 μ sec before $\overline{\text{POR}}$ transitions high.
	SGMII will not be used.	SRIOSGMIICLK is not used and should be tied to a static state.
PCIECLK	PCIE will be used as a boot device.	PCIECLK must be present 16 μ sec before $\overline{\text{POR}}$ transitions high.
	PCIE will be used after boot.	PCIECLK is used as a source to the PCIE SERDES PLL. It must be present before the PCIE is removed from reset and programmed.
	PCIE will not be used.	PCIECLK is not used and should be tied to a static state.
End of Table 7-4		

7.2.2 Power-Down Sequence

The power down sequence is the exact reverse of the power-up sequence described above. The goal is to prevent a large amount of static current and to prevent overstress of the device. A power-good circuit that monitors all the supplies for the device should be used in all designs. If a catastrophic power supply failure occurs on any voltage rail, $\overline{\text{POR}}$ should transition to low to prevent over-current conditions that could possibly impact device reliability.

A system power monitoring solution is needed to shut down power to the board if a power supply fails. Long-term exposure to an environment in which one of the power supply voltages is no longer present will affect the reliability of the device. Holding the device in reset is not an acceptable solution because prolonged periods of time with an active reset can also affect long term reliability.

7.2.3 Power Supply Decoupling and Bulk Capacitors

In order to properly decouple the supply planes on the PCB from system noise, decoupling and bulk capacitors are required. Bulk capacitors are used to minimize the effects of low frequency current transients and decoupling or bypass capacitors are used to minimize higher frequency noise. For recommendations on selection of Power Supply Decoupling and Bulk capacitors see the *Hardware Design Guide for KeyStone Devices* in “[Related Documentation from Texas Instruments](#)” on page 64.

7.2.4 SmartReflex

Increasing the device complexity increases its power consumption and with the smaller transistor structures responsible for higher achievable clock rates and increased performance, comes an inevitable penalty, increasing the leakage currents. Leakage currents are present in any active circuit, independently of clock rates and usage scenarios. This static power consumption is mainly determined by transistor type and process technology. Higher clock rates also increase dynamic power, the power used when transistors switch. The dynamic power depends mainly on a specific usage scenario, clock rates, and I/O activity.

Texas Instruments' SmartReflex technology is used to decrease both static and dynamic power consumption while maintaining the device performance. SmartReflex in the TMS320C6654 device is a feature that allows the core voltage to be optimized based on the process corner of the device. This requires a voltage regulator for each TMS320C6654 device.

To guarantee maximizing performance and minimizing power consumption of the device, SmartReflex is required to be implemented whenever the TMS320C6654 device is used. The voltage selection is done using 4 VCNTL pins which are used to select the output voltage of the core voltage regulator.

For information on implementation of SmartReflex see the *Power Management for KeyStone Devices* application report and the *Hardware Design Guide for KeyStone Devices* in “[Related Documentation from Texas Instruments](#)” on page 64.

7.3 Power Sleep Controller (PSC)

The Power Sleep Controller (PSC) controls overall device power by turning off unused power domains and gating off clocks to individual peripherals and modules. The PSC provides the user with an interface to control several important power and clock operations.

For information on the Power Sleep Controller, see the *Power Sleep Controller (PSC) for KeyStone Devices User Guide* in [“Related Documentation from Texas Instruments”](#) on page 64.

7.3.1 Power Domains

The device has several power domains that can be turned on for operation or off to minimize power dissipation. The global power/sleep controller (GPSC) is used to control the power gating of various power domains.

[Table 7-6](#) shows the TMS320C6654 power domains.

Table 7-6 Power Domains

Domain	Block(s)	Note	Power Connection
0	Most peripheral logic	Cannot be disabled	Always on

15	Reserved	Reserved	Reserved
End of Table 7-6			

7.3.2 Clock Domains

Clock gating to each logic block is managed by the local power/sleep controllers (LPSCs) of each module. For modules with a dedicated clock or multiple clocks, the LPSC communicates with the PLL controller to enable and disable that module's clock(s) at the source. For modules that share a clock with other modules, the LPSC controls the clock gating.

Table 7-7 shows the TMS320C6654 clock domains.

Table 7-7 Clock Domains

LPSC Number	Module(s)	Notes

1 VCNTRLID register is available for debug purpose only.

7.4 Reset Controller

The reset controller detects the different type of resets supported on the TMS320C6654 device and manages the distribution of those resets throughout the device.

The device has several types of resets:

- Power-on reset
- Hard reset
- Soft reset
- CPU local reset

[Table 7-9](#) explains further the types of reset, the reset initiator, and the effects of each reset on the device. For more information on the effects of each reset on the PLL controllers and their clocks, see Section “[Reset Electrical Data / Timing](#)” on page 123

Table 7-9 Reset Types

Reset Type	Initiator	Effect on Device When Reset Occurs	RESETSTAT Pin Status
POR (Power on reset)	POR pin active low RESETFULL pin active low	Total reset of the chip. Everything on the device is reset to its default state in response to this. Activates the POR signal on chip, which is used to reset test/emu logic. Boot configurations are latched. ROM boot process is initiated.	Toggles RESETSTAT pin
Hard reset	RESET pin active low Emulation PLLCTL register (RSCTRL) Watchdog timers	Resets everything except for test/emu logic and reset isolation modules. Emulator and reset isolation modules stay alive during this reset. This reset is also different from POR in that the PLLCTL assumes power and clocks are stable when device reset is asserted. Boot configurations are not latched. ROM boot process is initiated.	Toggles RESETSTAT pin
Soft reset	RESET pin active low PLLCTL register (RSCTRL) Watchdog timers	Software can program these initiators to be hard or soft. Hard reset is the default, but can be programmed to be soft reset. Soft reset will behave like hard reset except that EMIF16 MMRs, DDR3 EMIF MMRs, sticky bits in PCIe MMRs, and external memory contents are retained. Boot configurations are not latched. ROM boot process is initiated.	Toggles RESETSTAT pin
C66x CorePac local reset	Software (through LPSC MMR) Watchdog timers LRESET pin	MMR bit in LPSC controls C66x CorePac local reset. Used by watchdog timers (in the event of a timeout) to reset C66x CorePac. Can also be initiated by LRESET device pin. C66x CorePac memory system and slave DMA port are still alive when C66x CorePac is in local reset. Provides a local reset of the C66x CorePac, without destroying clock alignment or memory contents. Does not initiate ROM boot process.	Does not toggle RESETSTAT pin

End of Table 7-9

7.4.1 Power-on Reset

Power-on reset is used to reset the entire device, including the test and emulation logic.

Power-on reset is initiated by the following

1. $\overline{\text{POR}}$ pin
2. $\overline{\text{RESETFULL}}$ pin

During power-up, the $\overline{\text{POR}}$ pin must be asserted (driven low) until the power supplies have reached their normal operating conditions. A $\overline{\text{RESETFULL}}$ pin is also provided to allow the on-board host to reset the entire device including the reset isolated logic. The assumption is that the device is already powered up and hence, unlike the $\overline{\text{POR}}$ pin, the $\overline{\text{RESETFULL}}$ pin will be driven by the on-board host control instead of the power-good circuitry. For power-on reset, the Main PLL Controller comes up in bypass mode and the PLL is not enabled. Other resets do not affect the state of the PLL or the dividers in the PLL controller.

The following sequence must be followed during a power-on reset:

1. Wait for all power supplies to reach normal operating conditions while keeping the $\overline{\text{POR}}$ pin asserted (driven low). While $\overline{\text{POR}}$ is asserted, all pins except $\overline{\text{RESETSTAT}}$ will be set to high-impedance. After the $\overline{\text{POR}}$ pin is de-asserted (driven high), all Z group pins, low group pins, and high group pins are set to their reset state and will remain at their reset state until otherwise configured by their respective peripheral. All peripherals that are power managed, are disabled after a power-on reset and must be enabled through the Device State Control Registers (for more details, see Section Table 3-2 “[Device State Control Registers](#)” on page 66).
2. Clocks are reset, and they are propagated throughout the device to reset any logic that was using reset synchronously. All logic is now reset and $\overline{\text{RESETSTAT}}$ will be driven low indicating that the device is in reset.
3. $\overline{\text{POR}}$ must be held active until all supplies on the board are stable then for at least an additional time for the chip-level PLLs to lock.
4. The $\overline{\text{POR}}$ pin can now be de-asserted. Reset-sampled pin values are latched at this point. The chip level PLLs are taken out of reset and begin their locking sequence, and all power-on device initialization also begins.
5. After device initialization is complete, the $\overline{\text{RESETSTAT}}$ pin is de-asserted (driven high). By this time, the DDR3 PLL has already completed its locking sequence and is outputting a valid clock. The system clocks of both PLL controllers are allowed to finish their current cycles and then paused for 10 cycles of their respective system reference clocks. After the pause, the system clocks are restarted at their default divide by settings.
6. The device is now out of reset and device execution begins as dictated by the selected boot mode.

Note—To most of the device, reset is de-asserted only when the $\overline{\text{POR}}$ and $\overline{\text{RESET}}$ pins are both de-asserted (driven high). Therefore, in the sequence described above, if the $\overline{\text{RESET}}$ pin is held low past the low period of the $\overline{\text{POR}}$ pin, most of the device will remain in reset. The $\overline{\text{RESET}}$ pin should not be tied together with the $\overline{\text{POR}}$ pin.

7.4.2 Hard Reset

A hard reset will reset everything on the device except the PLLs, test, emulation logic, and reset isolation modules. $\overline{\text{POR}}$ should also remain de-asserted during this time.

Hard reset is initiated by the following:

- $\overline{\text{RESET}}$ pin
- RCTRL register in PLLCTL
- Watchdog timer
- Emulation

All the above initiators, by default, are configured to act as a hard reset. Except emulation, all the other three initiators can be configured as soft resets in the RSCFG register in PLLCTL.

The following sequence must be followed during a hard reset:

1. The $\overline{\text{RESET}}$ pin is pulled active low for a minimum of 24 input clock cycles. During this time, the $\overline{\text{RESET}}$ signal is able to propagate to all modules (except those specifically mentioned above). All I/O are Hi-Z for modules affected by $\overline{\text{RESET}}$, to prevent off-chip contention during the warm reset.
2. Once all logic is reset, $\overline{\text{RESETSTAT}}$ is driven active to denote that the device is in reset.
3. The $\overline{\text{RESET}}$ pin can now be released. A minimal device initialization begins to occur. Note that configuration pins are not re-latched and clocking is unaffected within the device.
4. After device initialization is complete, the $\overline{\text{RESETSTAT}}$ pin is de-asserted (driven high).

Note—The $\overline{\text{POR}}$ pin should be held inactive (high) throughout the warm reset sequence. Otherwise, if $\overline{\text{POR}}$ is activated (brought low), the minimum POR pulse width must be met. The $\overline{\text{RESET}}$ pin should not be tied together with the $\overline{\text{POR}}$ pin.

7.4.3 Soft Reset

A soft reset will behave like a hard reset except that the PCIe MMR sticky bits and DDR3 EMIF MMRs contents are retained. $\overline{\text{POR}}$ should also remain de-asserted during this time.

Soft reset is initiated by the following:

- $\overline{\text{RESET}}$ pin
- RCTRL register in PLLCTL
- Watchdog timer

All the above initiators by default are configured to act as hard reset. Except emulation, all the other three initiators can be configured as soft resets in the RSCFG register in PLLCTL.

In the case of a soft reset, the clock logic or the power control logic of the peripherals are not affected, and, therefore, the enabled/disabled state of the peripherals is not affected. On a soft reset, the DDR3 memory controller registers are not reset. In addition, the DDR3 SDRAM memory content is retained if the user places the DDR3 SDRAM in self-refresh mode before invoking the soft reset.

During a soft reset, the following happens:

1. The $\overline{\text{RESETSTAT}}$ pin goes low to indicate an internal reset is being generated. The reset is allowed to propagate through the system. Internal system clocks are not affected. PLLs also remain locked.
2. After device initialization is complete, the $\overline{\text{RESETSTAT}}$ pin is deasserted (driven high). In addition, the PLL controllers pause their system clocks for about 8 cycles.

At this point:

- › The state of the peripherals before the soft reset is not changed.
- › The I/O pins are controlled as dictated by the DEVSTAT register.
- › The DDR3 MMRs and PCIe MMR sticky bits retain their previous values. Only the DDR3 Memory Controller and PCIe state machines are reset by the soft reset.
- › The PLL controllers are operating in the mode prior to soft reset. System clocks are unaffected.

The boot sequence is started after the system clocks are restarted. Since the configuration pins are not latched with a system reset, the previous values, as shown in the DEVSTAT register, are used to select the boot mode.

7.4.4 Local Reset

The local reset can be used to reset a particular CorePac without resetting any other chip components.

Local reset is initiated by the following (for more details see the *Phase Locked Loop (PLL) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64:

- LRESET pin
- Watchdog timer should cause one of the below based on the setting of the CORESEL[2:0] and RSTCFG register in the PLL controller. See “[Reset Configuration Register \(RSTCFG\)](#)” on page 134 and “[CIC Registers](#)” on page 159:
 - Local Reset
 - NMI
 - NMI followed by a time delay and then a local reset for the CorePac selected
 - Hard Reset by requesting reset via PLLCTL
- LPSC MMRs (memory-mapped registers)

7.4.5 Reset Priority

If any of the above reset sources occur simultaneously, the PLLCTL processes only the highest priority reset request. The reset request priorities are as follows (high to low):

- Power-on reset
- Hard/soft reset

7.4.6 Reset Controller Register

The reset controller register is part of the PLLCTL MMRs. All C6654 device-specific MMRs are covered in Section 7.5.3 “[Main PLL Control Register](#)” on page 135. For more details on these registers and how to program them, see the *Phase Locked Loop (PLL) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

7.5 Main PLL and PLL Controller

This section provides a description of the Main PLL and the PLL controller. For details on the operation of the PLL controller module, see the *Phase Locked Loop (PLL) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

The Main PLL is controlled by the standard PLL controller. The PLL controller manages the clock ratios, alignment, and gating for the system clocks to the device. [Figure 7-7](#) shows a block diagram of the main PLL and the PLL controller.

Figure 7-7 Main PLL and PLL Controller

Note—NOTE: PLLM[5:0] bits of the multiplier are controlled by the PLLM register inside the PLL controller and PLLM[12:6] bits are controlled by the chip level MAINPLLCTL0 register. The complete 13-bit value is latched when the GO operation is initiated in the PLL controller. Only PLLDIV2, PLLDIV5, and PLLDIV8 are programmable on the C6654 device. See the *Phase Locked Loop (PLL) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64 for more details on how to program the PLL controller.

The multiplication and division ratios within the PLL and the post-division for each of the chip-level clocks are determined by a combination of this PLL and the PLL Controller. The PLL controller also controls reset propagation through the chip, clock alignment, and test points. The PLL controller monitors the PLL status and provides an output signal indicating when the PLL is locked.

Main PLL power is supplied externally via the Main PLL power-supply pin (AVDDA1). An external EMI filter circuit must be added to all PLL supplies. See the *Hardware Design Guide for KeyStone Devices* in “[Related Documentation from Texas Instruments](#)” on page 64 for detailed recommendations. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than those shown. For reduced PLL jitter, maximize the spacing between switching signal traces and the PLL external components (C1, C2, and the EMI Filter).

The minimum SYSCLK rise and fall times should also be observed. For the input clock timing requirements, see Section 7.5.5 “[Main PLL Controller/PCIe Clock Input Electrical Data/Timing](#)”.

CAUTION—The PLL controller module as described in the see the *Phase Locked Loop (PLL) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64 includes a superset of features, some of which are not supported on the TMS320C6654 device. The following sections describe the registers that are supported; it should be assumed that any registers not included in these sections is not supported by the device. Furthermore, only the bits within the registers described here are supported. Avoid writing to any reserved memory location or changing the value of reserved bits.

7.5.1 Main PLL Controller Device-Specific Information

7.5.1.1 Internal Clocks and Maximum Operating Frequencies

The Main PLL, used to drive the CorePacs, the switch fabric, and a majority of the peripheral clocks (all but the DDR3) requires a PLL controller to manage the various clock divisions, gating, and synchronization. The Main PLL’s PLL controller has several SYSCLK outputs that are listed below, along with the clock description. Each SYSCLK has a corresponding divider that divides down the output clock of the PLL. Note that dividers are not programmable unless explicitly mentioned in the description below.

- **SYSCLK1:** Full-rate clock for the CorePac.
- **SYSCLK2:** 1/x-rate clock for CorePac emulation. The default rate for this is 1/3. It is programmable from 1/1 to 1/32, where this clock does not violate the max of 350 MHz. The SYSCLK2 can be turned off by software.
- **SYSCLK3:** 1/2-rate clock used to clock the MSMC and DDR EMIF.
- **SYSCLK4:** 1/3-rate clock for the switch fabrics and fast peripherals. The Debug_SS and ETBs use this as well.
- **SYSCLK5:** 1/y-rate clock for the system trace module only. The default rate for this is 1/5. It is configurable and the max configurable clock is 210 MHz and min configurable clock is 32 MHz. The SYSCLK5 can be turned off by software.
- **SYSCLK6:** 1/64-rate clock. 1/64 rate clock (emif_ptv) used to clock the PVT-compensated buffers for DDR3 EMIF.
- **SYSCLK7:** 1/6-rate clock for slow peripherals and sources the SYSCLKOUT output pin.

- **SYSCLK8:** 1/z-rate clock. This clock is used as slow_sysclk in the system. Default is 1/64. It is programmable from /24 to /80.
- **SYSCLK9:** 1/12-rate clock for SmartReflex.
- **SYSCLK11:** 1/6-rate clock for PSC only.

Only SYSCLK2, SYSCLK5, and SYSCLK8 are programmable on the TMS320C6654 device.

Note—In case any of the other programmable SYSCLKs are set slower than 1/64 rate, then SYSCLK8 (SLOW_SYSCLK) needs to be programmed to either match, or be slower than, the slowest SYSCLK in the system.

7.5.1.2 Main PLL Controller Operating Modes

The Main PLL controller has two modes of operation: bypass mode and PLL mode. The mode of operation is determined by BYPASS bit of the PLL Secondary Control Register (SECCTL). In PLL mode, SYSCLK1 is generated from the PLL output using the values set in PLLM and PLLD bit fields in the MAINPLLCTL0 Register. In bypass mode, PLL input is fed directly out as SYSCLK1.

All hosts must hold off accesses to the DSP while the frequency of its internal clocks is changing. A mechanism must be in place such that the DSP notifies the host when the PLL configuration has completed.

7.5.1.3 Main PLL Stabilization, Lock, and Reset Times

The PLL stabilization time is the amount of time that must be allotted for the internal PLL regulators to become stable after device powerup. The PLL should not be operated until this stabilization time has elapsed.

The PLL reset time is the amount of wait time needed when resetting the PLL (writing PLLRST = 1), in order for the PLL to properly reset, before bringing the PLL out of reset (writing PLLRST = 0). For the Main PLL reset time value, see [Table 7-13](#).

The PLL lock time is the amount of time needed from when the PLL is taken out of reset (PLLRST = 1 with PLEN = 0) to when to when the PLL controller can be switched to PLL mode (PLEN = 1). The Main PLL lock time is given in [Table 7-13](#).

Table 7-13 Main PLL Stabilization, Lock, and Reset Times

	Min	Typ	Max	Unit
PLL stabilization time	100			μs
PLL lock time		$500 \times (\text{PLLD}^{(1)} + 1) \times C^{(2)}$		
PLL reset time	1000			ns
End of Table 7-13				

1 PLLD is the value in PLLD bit fields of MAINPLLCTL0 register

2 C = SYSCLK1(N|P) cycle time in ns.

7.5.2 PLL Controller Memory Map

The memory map of the PLL controller is shown in [Table 7-14](#). TMS320C6654-specific PLL Controller register definitions can be found in the sections following [Table 7-14](#). For other registers in the table, see the *Phase Locked Loop (PLL) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

CAUTION—Note that only registers documented here are accessible on the TMS320C6654. Other addresses in the PLL controller memory map including the reserved registers should not be modified. Furthermore, only the bits within the registers described here are supported. Avoid writing to any reserved memory location or changing the value of reserved bits. It is recommended to use read-modify-write sequence to make any changes to the valid bits in the register.

Table 7-14 PLL Controller Registers (Including Reset Controller) (Part 1 of 2)

Hex Address Range	Field	Register Name
0231 0000 - 0231 00E3	-	Reserved
0231 00E4	RSTYPE	Reset Type Status Register (Reset Controller)
0231 00E8	RSTCTRL	Software Reset Control Register (Reset Controller)
0231 00EC	RSTCFG	Reset Configuration Register (Reset Controller)
0231 00F0	RSISO	Reset Isolation Register (Reset Controller)
0231 00F0 - 0231 00FF	-	Reserved
0231 0100	PLLCTL	PLL Control Register
0231 0104	-	Reserved
0231 0108	SECCTL	PLL Secondary Control Register
0231 010C	-	Reserved
0231 0110	PLLM	PLL Multiplier Control Register
0231 0114	-	Reserved
0231 0118	PLLDIV1	Reserved
0231 011C	PLLDIV2	PLL Controller Divider 2 Register
0231 0120	PLLDIV3	Reserved
0231 0124	-	Reserved
0231 0128	-	Reserved
0231 012C - 0231 0134	-	Reserved
0231 0138	PLLCMD	PLL Controller Command Register
0231 013C	PLLSTAT	PLL Controller Status Register
0231 0140	ALNCTL	PLL Controller Clock Align Control Register
0231 0144	DCHANGE	PLLDIV Ratio Change Status Register
0231 0148	CKEN	Reserved
0231 014C	CKSTAT	Reserved
0231 0150	SYSTAT	SYSCLK Status Register
0231 0154 - 0231 015C	-	Reserved
0231 0160	PLLDIV4	Reserved
0231 0164	PLLDIV5	PLL Controller Divider 5 Register
0231 0168	PLLDIV6	Reserved
0231 016C	PLLDIV7	Reserved
0231 0170	PLLDIV8	PLL Controller Divider 8 Register

Table 7-14 PLL Controller Registers (Including Reset Controller) (Part 2 of 2)

Hex Address Range	Field	Register Name
0231 0174 - 0231 0193	PLLDIV9 - PLLDIV16	Reserved
0231 0194 - 0231 01FF	-	Reserved
End of Table 7-14		

7.5.2.1 PLL Secondary Control Register (SECCTL)

The PLL Secondary Control Register contains extra fields to control the Main PLL and is shown in [Figure 7-8](#) and described in [Table 7-15](#).

Figure 7-8 PLL Secondary Control Register (SECCTL)

Legend: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-15 PLL Secondary Control Register (SECCTL) Field Descriptions

Bit	Field	Description
31-24	Reserved	Reserved
23	BYPASS	Main PLL Bypass Enable. 0 = Main PLL Bypass disabled. 1 = Main PLL Bypass enabled.
22-19	OUTPUT_DIVIDE	Output Divider ratio bits. 0h = ÷1. Divide frequency by 1. 1h = ÷2. Divide frequency by 2. 2h - Fh = Reserved.
18-0	Reserved	Reserved
End of Table 7-15		

7.5.2.2 PLL Controller Divider Register (PLLDIV2, PLLDIV5, PLLDIV8)

The PLL Controller Divider Registers (PLLDIV2, PLLDIV5, and PLLDIV8) are shown in [Figure 7-9](#) and described in [Table 7-16](#). The default values of the RATIO field on a reset for PLLDIV2, PLLDIV5, and PLLDIV8 are different and mentioned in the footnote of [Figure 7-9](#).

Figure 7-9 PLL Controller Divider Register (PLLDIVn)

31	16	15	14	8	7	0
Reserved		Dn ⁽¹⁾ EN	Reserved		RATIO	
R-0		R/W-1	R-0		R/W-n ⁽²⁾	

Legend: R/W = Read/Write; R = Read only; -n = value after reset

- 1 D2EN for PLLDIV2; D5EN for PLLDIV5; D8EN for PLLDIV8
- 2 n=02h for PLLDIV2; n=04h for PLLDIV5; n=3Fh for PLLDIV8

Table 7-16 PLL Controller Divider Register (PLLDIVn) Field Descriptions

Bit	Field	Description
31-16	Reserved	Reserved.
15	DnEN	Divider Dn enable bit. (see footnote of Figure 7-9) 0 = Divider n is disabled. 1 = No clock output. Divider n is enabled.
14-8	Reserved	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
7-0	RATIO	Divider ratio bits. (see footnote of Figure 7-9) 0h = ÷1. Divide frequency by 1. 1h = ÷2. Divide frequency by 2. 2h = ÷3. Divide frequency by 3. 3h = ÷4. Divide frequency by 4. 4h - 4Fh = ÷5 to ÷80. Divide frequency by 5 to divide frequency by 80.
End of Table 7-16		

7.5.2.3 PLL Controller Clock Align Control Register (ALNCTL)

The PLL controller clock align control register (ALNCTL) is shown in [Figure 7-10](#) and described in [Table 7-17](#).

Figure 7-10 PLL Controller Clock Align Control Register (ALNCTL)

31	8	7	6	5	4	3	2	1	0
Reserved		ALN8	Reserved	ALN5	Reserved	ALN2	Reserved		
R-0		R/W-1	R-0	R/W-1	R-0	R/W-1	R-0		

Legend: R/W = Read/Write; R = Read only; -n = value after reset, for reset value

Table 7-17 PLL Controller Clock Align Control Register (ALNCTL) Field Descriptions

Bit	Field	Description
31-8 6-5 3-2 0	Reserved	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
7 4 1	ALN8 ALN5 ALN2	SYSClKn alignment. Do not change the default values of these fields. 0 = Do not align SYSClKn to other SYSClKs during GO operation. If SYSn in DCHANGE is set, SYSClKn switches to the new ratio immediately after the GOSET bit in PLLCMD is set. 1 = Align SYSClKn to other SYSClKs selected in ALNCTL when the GOSET bit in PLLCMD is set and SYSn in DCHANGE is 1. The SYSClKn rate is set to the ratio programmed in the RATIO bit in PLLDIVn.
End of Table 7-17		

7.5.2.4 PLLDIV Divider Ratio Change Status Register (DCHANGE)

When a different ratio is written to the PLLDIV n registers, the PLLCTL flags the change in the DCHANGE Status Register. During the GO operation, the PLL controller will change only the divide ratio of the SYSCLKs with the bit set in DCHANGE. Note that the ALNCTL Register determines if that clock also needs to be aligned to other clocks. The PLLDIV divider ratio change status register is shown in [Figure 7-11](#) and described in [Table 7-18](#).

Figure 7-11 PLLDIV Divider Ratio Change Status Register (DCHANGE)

31	8	7	6	5	4	3	2	1	0
Reserved		SYS8	Reserved		SYS5	Reserved		SYS2	Reserved
R-0		R/W-0	R-0		R/W-0	R-0		R/W-0	R-0

Legend: R/W = Read/Write; R = Read only; -n = value after reset, for reset value

Table 7-18 PLLDIV Divider Ratio Change Status Register (DCHANGE) Field Descriptions

Bit	Field	Description
31-8 6-5 3-2 0	Reserved	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
7 4 1	SYS8 SYS5 SYS2	Identifies when the SYSCLK n divide ratio has been modified. 0 = SYSCLK n ratio has not been modified. When GOSET is set, SYSCLK n will not be affected. 1 = SYSCLK n ratio has been modified. When GOSET is set, SYSCLK n will change to the new ratio.
End of Table 7-18		

7.5.2.5 SYSCLK Status Register (SYSTAT)

The SYSCLK Status Register (SYSTAT) shows the status of SYSCLK[11:1]. SYSTAT is shown in [Figure 7-12](#) and described in [Table 7-19](#).

Figure 7-12 SYSCLK Status Register (SYSTAT)

31	11	10	9	8	7	6	5	4	3	2	1	0
Reserved		SYS11ON	SYS10ON	SYS9ON	SYS8ON	SYS7ON	SYS6ON	SYS5ON	SYS4ON	SYS3ON	SYS2ON	SYS1ON
R-n		R-1	R-1	R-1	R-1	R-1	R-1	R-1	R-1	R-1	R-1	R-1

Legend: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-19 SYSCLK Status Register (SYSTAT) Field Descriptions

Bit	Field	Description
31-11	Reserved	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
10-0	SYS[N ⁽¹⁾]ON	SYSCLK[N] on status. 0 = SYSCLK[N] is gated. 1 = SYSCLK[N] is on.
End of Table 7-19		

1 Where N = 1, 2, 3,...N (Not all these output clocks may be used on a specific device. For more information, see the device-specific data manual)

7.5.2.6 Reset Type Status Register (RSTYPE)

The Reset Type Status (RSTYPE) Register latches the cause of the last reset. If multiple reset sources occur simultaneously, this register latches the highest priority reset source. The Reset Type Status Register is shown in Figure 7-13 and described in Table 7-20.

Figure 7-13 Reset Type Status Register (RSTYPE)

31	29	28	27	12	11	8	7	3	2	1	0
Reserved		EMU-RST	Reserved		WDRST[N]		Reserved		PLLCTLRST	$\overline{\text{RESET}}$	POR
R-0		R-0	R-0		R-0		R-0		R-0	R-0	R-0

Legend: R = Read only; -n = value after reset

Table 7-20 Reset Type Status Register (RSTYPE) Field Descriptions

Bit	Field	Description
31-29	Reserved	Reserved. Read only. Always reads as 0. Writes have no effect.
28	EMU-RST	Reset initiated by emulation. 0 = Not the last reset to occur. 1 = The last reset to occur.
27-12	Reserved	Reserved. Read only. Always reads as 0. Writes have no effect.
11	WDRST3	Reset initiated by watchdog timer[N]. 0 = Not the last reset to occur. 1 = The last reset to occur.
10	WDRST2	
9	WDRST1	
8	WDRST0	
7-3	Reserved	Reserved. Read only. Always reads as 0. Writes have no effect.
2	PLLCTLRST	Reset initiated by PLLCTL. 0 = Not the last reset to occur. 1 = The last reset to occur.
1	$\overline{\text{RESET}}$	$\overline{\text{RESET}}$ reset. 0 = $\overline{\text{RESET}}$ was not the last reset to occur. 1 = $\overline{\text{RESET}}$ was the last reset to occur.
0	POR	Power-on reset. 0 = Power-on reset was not the last reset to occur. 1 = Power-on reset was the last reset to occur.
End of Table 7-20		

7.5.2.7 Reset Control Register (RSTCTRL)

This register contains a key that enables writes to the MSB of this register and the RSTCFG Register. The key value is 0x5A69. A valid key will be stored as 0x000C, any other key value is invalid. When the RSTCTRL or the RSTCFG is written, the key is invalidated. Every write must be set up with a valid key. The Software Reset Control Register (RSTCTRL) is shown in Figure 7-14 and described in Table 7-21.

Figure 7-14 Reset Control Register (RSTCTRL)

31	17	16	15	0
Reserved		SWRST	KEY	
R-0x0000		R/W-0x ⁽¹⁾	R/W-0x0003	

Legend: R = Read only; -n = value after reset;

¹ Writes are conditional based on valid key.

Table 7-21 Reset Control Register (RSTCTRL) Field Descriptions

Bit	Field	Description
31-17	Reserved	Reserved.
16	SWRST	Software reset 0 = Reset 1 = Not reset
15-0	KEY	Key used to enable writes to RSTCTRL and RSTCFG.
End of Table 7-21		

7.5.2.8 Reset Configuration Register (RSTCFG)

This register is used to configure the type of reset initiated by $\overline{\text{RESET}}$, watchdog timer and the PLL controller's RSTCTRL Register; i.e., a hard reset or a soft reset. By default, these resets will be hard resets. The Reset Configuration Register (RSTCFG) is shown in Figure 7-15 and described in Table 7-22.

Figure 7-15 Reset Configuration Register (RSTCFG)

Legend: R = Read only; R/W = Read/Write; -n = value after reset

1 Where N = 1, 2, 3,...,N (Not all these output may be used on a specific device. For more information, see the device-specific data manual)

2 Writes are conditional based on valid key. For details, see Section 7.5.2.7 "Reset Control Register (RSTCTRL)".

Table 7-22 Reset Configuration Register (RSTCFG) Field Descriptions

Bit	Field	Description
31-14	Reserved	Reserved.
13	PLLCLRSTTYPE	PLL controller initiates a software-driven reset of type: 0 = Hard reset (default) 1 = Soft reset
12	$\overline{\text{RESET}}\text{TYPE}$	$\overline{\text{RESET}}$ initiates a reset of type: 0 = Hard Reset (default) 1 = Soft Reset
11-4	Reserved	Reserved.
3	WDTYPE3	Watchdog timer [N] initiates a reset of type: 0 = Hard Reset (default) 1 = Soft Reset
2	WDTYPE2	
1	WDTYPE1	
0	WDTYPE0	
End of Table 7-22		

7.5.2.9 Reset Isolation Register (RSISO)

This register is used to select the module clocks that must maintain their clocking without pausing through non power-on reset. Setting any of these bits effectively blocks reset to all PLLCTL registers in order to maintain current values of PLL multiplier, divide ratios, and other settings. Along with setting module specific bit in RSISO, the corresponding MDCTLx[12] bit also needs to be set in PSC to reset-isolate a particular module. For more information on MDCTLx Register see the *Power Sleep Controller (PSC) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64. The Reset Isolation Register (RSTCTRL) is shown below.

Figure 7-16 Reset Isolation Register (RSISO)

31	10	9	8	7	0
Reserved		Reserved	SRISO	Reserved	
R-0		R/W-0	R/W-0	R-0	

Legend: R = Read only; R/W = Read/Write; -n = value after reset

Table 7-23 Reset Isolation Register (RSISO) Field Descriptions

Bit	Field	Description
31-10	Reserved	Reserved.
9	Reserved	Reserved.
8	SRISO	Isolate SmartReflex 0 = Not reset isolated 1 = Reset Isolated
7-0	Reserved	Reserved.
End of Table 7-23		

7.5.3 Main PLL Control Register

The Main PLL uses two chip-level registers (MAINPLLCTL0 and MAINPLLCTL1) along with the PLL controller for its configuration. These MMRs exist inside the Bootcfg space. To write to these registers, software should go through an unlocking sequence using KICK0/KICK1 registers. For valid configurable values into the MAINPLLCTL0 and MAINPLLCTL1 Registers, see Section 2.5.3 “[PLL Boot Configuration Settings](#)” on page 32. See section 3.3.4 “[Kicker Mechanism \(KICK0 and KICK1\) Register](#)” on page 71 for the address location of the registers and locking and unlocking sequences for accessing the registers. The registers are reset on POR only.

Figure 7-17 Main PLL Control Register 0 (MAINPLLCTL0)

Legend: RW = Read/Write; -n = value after reset

Table 7-25 Main PLL Control Register 1 (MAINPLLCTL1) Field Descriptions

Bit	Field	Description
31-7	Reserved	Reserved
6	ENSAT	Needs to be set to 1 for proper operation of PLL
5-4	Reserved	Reserved
3-0	BWADJ[11:8]	BWADJ[11:8] and BWADJ[7:0] are located in separate registers. The combination (BWADJ[11:0]) should be programmed to a value equal to half of PLLM[12:0] if PLLM has even values or to be rounded half down of PLLM[12:0] if PLLM has odd values. Example: PLLM=15, then BWADJ=7
End of Table 7-25		

Note—PLLM[5:0] bits of the multiplier are controlled by the PLLM Register inside the PLL controller and PLLM[12:6] bits are controlled by the MAINPLLCTL0 chip-level register. The MAINPLLCTL0 Register PLLM[12:6] bits should be written just before writing to the PLLM Register PLLM[5:0] bits in the controller to have the complete 13-bit value latched when the GO operation is initiated in the PLL controller. See the *Phase Locked Loop (PLL) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64 for the recommended programming sequence. Output divide ratio and bypass enable/disable of the Main PLL is controlled by the SECCTL Register in the PLL Controller. See the 7.5.2.1 “[PLL Secondary Control Register \(SECCTL\)](#)” for more details.

7.5.4 Main PLL and PLL Controller Initialization Sequence

See the *Phase Locked Loop (PLL) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64 for details on the initialization sequence for Main PLL and PLL Controller.

7.5.5 Main PLL Controller/PCIe Clock Input Electrical Data/Timing

Figure 7-19 Main PLL Controller/PCIe Clock Input Timing

Figure 7-20 Main PLL Clock Input Transition Time

7.6 DD3 PLL

The DDR3 PLL generates interface clocks for the DDR3 memory controller. When coming out of power-on reset, the DDR3 PLL is programmed to a valid frequency during the boot config before being enabled and used.

DDR3 PLL power is supplied externally via the Main PLL power-supply pin (AVDDA2). An external EMI filter circuit must be added to all PLL supplies. See the *Hardware Design Guide for KeyStone Devices* in “[Related Documentation from Texas Instruments](#)” on page 64. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than those shown. For reduced PLL jitter, maximize the spacing between switching signal traces and the PLL external components (C1, C2, and the EMI Filter).

Figure 7-21 shows the DDR3 PLL.

Figure 7-21 DDR3 PLL Block Diagram

7.6.1 DDR3 PLL Control Register

The DDR3 PLL, which is used to drive the DDR PHY for the EMIF, does not use a PLL controller. The DDR3 PLL can be controlled using the **DDR3PLLCTL0** and **DDR3PLLCTL1** Registers located in the Bootcfg module. These MMRs exist inside the Bootcfg space. To write to these registers, software should go through an un-locking sequence using the **KICK0/KICK1** registers. For suggested configurable values, see section 3.3.4 “[Kicker Mechanism \(KICK0 and KICK1\) Register](#)” on page 71 for the address location of the registers and locking and unlocking sequences for accessing the registers. This register is reset on $\overline{\text{POR}}$ only.

Figure 7-22 DDR3 PLL Control Register 0 (DDR3PLLCTL0) ⁽¹⁾

12-7	Reserved	Reserved
6	ENSAT	Needs to be set to 1 for proper operation of the PLL
5-4	Reserved	Reserved
3-0	BWADJ[11:8]	BWADJ[11:8] and BWADJ[7:0] are located in separate registers. The combination (BWADJ[11:0]) should be programmed to a value equal to half of PLLM[12:0] if PLLM has even values or to be rounded half down of PLLM[12:0] if PLLM has odd values. Example: PLLM=15, then BWADJ=7
End of Table 7-28		

7.6.2 DDR3 PLL Device-Specific Information

As shown in [Figure 7-21](#), the output of DDR3 PLL (PLLOUT) is divided by 2 and directly fed to the DDR3 memory controller. The DDR3 PLL is affected by power-on reset. During power-on resets, the internal clocks of the DDR3 PLL are affected as described in Section 7.4 [“Reset Controller”](#) on page 119. The DDR3 PLL is unlocked only during the power-up sequence and is locked by the time the RESETSTAT pin goes high. It does not lose lock during any of the other resets.

7.6.3 DDR3 PLL Initialization Sequence

See the *Phase Locked Loop (PLL) for KeyStone Devices User Guide* in [“Related Documentation from Texas Instruments”](#) on page 64 for details on the initialization sequence for DDR3 PLL.

Figure 7-24 DDR3 PLL DDRCLK Timing

7.7 Enhanced Direct Memory Access (EDMA3) Controller

The primary purpose of the EDMA3 is to service user-programmed data transfers between two memory-mapped slave endpoints on the device. The EDMA3 services software-driven paging transfers (e.g., data movement between external memory and internal memory), performs sorting or subframe extraction of various data structures, services event driven peripherals, and offloads data transfers from the device CPU.

There is one EDMA Channel Controller on the C6654 device: EDMA3_CC. It has four transfer controllers: TC0, TC1, TC2, and TC3. In the context of this document, TCx associated with CC is referred to as EDMA3_CC_TCx. Each of the transfer controllers has a direct connection to the switch fabric. Section 4.2 “[Switch Fabric Connections Matrix](#)” lists the peripherals that can be accessed by the transfer controllers.

The EDMA3 Channel Controller includes the following features:

- Fully orthogonal transfer description
 - Three transfer dimensions:
 - › Array (multiple bytes)
 - › Frame (multiple arrays)
 - › Block (multiple frames)
 - Single event can trigger transfer of array, frame, or entire block
 - Independent indexes on source and destination
- Flexible transfer definition:
 - Increment or FIFO transfer addressing modes
 - Linking mechanism allows for ping-pong buffering, circular buffering, and repetitive/continuous transfers, all with no CPU intervention
 - Chaining allows multiple transfers to execute with one event
- 512 PaRAM entries
 - Used to define transfer context for channels
 - Each PaRAM entry can be used as a DMA entry, QDMA entry, or link entry
- 64 DMA channels
 - Manually triggered (CPU writes to channel controller register), external event triggered, and chain triggered (completion of one transfer triggers another)
- Eight Quick DMA (QDMA) channels
 - Used for software-driven transfers
 - Triggered upon writing to a single PaRAM set entry
- Four transfer controllers and four event queues with programmable system-level priority
- Interrupt generation for transfer completion and error conditions
- Debug visibility
 - Queue watermarking/threshold allows detection of maximum usage of event queues
 - Error and status recording to facilitate debug

7.7.1 EDMA3 Device-Specific Information

The EDMA supports two addressing modes: constant addressing and increment addressing mode. Constant addressing mode is applicable to a very limited set of use cases. For most applications, increment mode must be used. On the C6654, the EDMA can use constant addressing mode only with the Enhanced Viterbi-Decoder Coprocessor (VCP) and the Enhanced Turbo Decoder Coprocessor (TCP). Constant addressing mode is not supported by any

other peripheral or internal memory in the device. Note that increment mode is supported by all peripherals, including VCP and TCP. For more information on these two addressing modes, see the *Enhanced Direct Memory Access 3 (EDMA3) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

For the range of memory addresses that include EDMA3 channel controller (EDMA3_CC) control registers and EDMA3 transfer controller (TC) control register, see Section Table 2-2 “[Memory Map Summary](#)” on page 21. For memory offsets and other details on EDMA3_CC and TC control registers entries, see the *Enhanced Direct Memory Access 3 (EDMA3) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

7.7.2 EDMA3 Channel Controller Configuration

[Table 7-30](#) provides the configuration of the EDMA3 channel controller present on the device.

Table 7-30 EDMA3 Channel Controller Configuration

Description	EDMA3 CC
Number of DMA channels in Channel Controller	64
Number of QDMA channels	8
Number of interrupt channels	64
Number of PaRAM set entries	512
Number of event queues	4
Number of Transfer Controllers	4
Memory Protection Existence	Yes
Number of Memory Protection and Shadow Regions	8
End of Table 7-30	

7.7.3 EDMA3 Transfer Controller Configuration

Each transfer controller on a device is designed differently based on considerations like performance requirements, system topology (like main TeraNet bus width, external memory bus width), and so on. The parameters that determine the transfer controller configurations are:

- **FIFOSIZE:** Determines the size in bytes for the data FIFO that is the temporary buffer for the in-flight data. The data FIFO is where the read return data read by the TC read controller from the source endpoint is stored and subsequently written out to the destination endpoint by the TC write controller.
- **BUSWIDTH:** The width of the read and write data buses, in bytes, for the TC read and write controller, respectively. This is typically equal to the bus width of the main TeraNet interface.
- **Default Burst Size (DBS):** The DBS is the maximum number of bytes per read/write command issued by a transfer controller.
- **DSTREGDEPTH:** This determines the number of destination FIFO register set. The number of destination FIFO register set for a transfer controller determines the maximum number of outstanding transfer requests.

All four parameters listed above are specified by the design of the device.

Table 7-31 provides the configuration of the EDMA3 transfer controller present on the device.

Table 7-31 EDMA3 Transfer Controller Configuration

Parameter	EDMA3 CC			
	TC0	TC1	TC2	TC3
FIFOSIZE	1024 bytes	512 bytes	512 bytes	1024 bytes
BUSWIDTH	16 bytes	16 bytes	16 bytes	16 bytes
DSTREGDEPTH	4 entries	4 entries	4 entries	4 entries
DBS	64 bytes	64 bytes	64 bytes	64 bytes
End of Table 7-31				

7.7.4 EDMA3 Channel Synchronization Events

The EDMA3 supports up to 64 DMA channels for EDMA3_CC that can be used to service system peripherals and to move data between system memories. DMA channels can be triggered by synchronization events generated by system peripherals. The following tables lists the source of the synchronization event associated with each of the EDMA3_CC DMA channels. On the C6654, the association of each synchronization event and DMA channel is fixed and cannot be reprogrammed.

For more detailed information on the EDMA3 module and how EDMA3 events are enabled, captured, processed, prioritized, linked, chained, and cleared, etc., see the *Enhanced Direct Memory Access 3 (EDMA3) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

7.8 Interrupts

7.8.1 Interrupt Sources and Interrupt Controller

The CPU interrupts on the C6654 device are configured through the C66x CorePac Interrupt Controller. The interrupt controller allows for up to 128 system events to be programmed to any of the twelve CPU interrupt inputs (CPUINT4 - CPUINT15), the CPU exception input (EXCEP), or the advanced emulation logic. The 128 system events consist of both internally-generated events (within the CorePac) and chip-level events.

Additional system events are routed to each of the C66x CorePacs to provide chip-level events that are not required as CPU interrupts/exceptions to be routed to the interrupt controller as emulation events. In addition, error-class events or infrequently used events are also routed through the system event router to offload the C66x CorePac interrupt selector. This is accomplished through CIC blocks, CIC[1:0]. This is clocked using CPU/6.

The event controllers consist of simple combination logic to provide additional events to the C66x CorePacs, plus the EDMA3_CC and CIC0 provide 12 additional events as well as 8 broadcast events to the C66x CorePacs. CIC1 provides 18 additional events to EDMA3_CC.

There are a large number of events on the chip level. The chip level CIC provides a flexible way to combine and remap those events. Multiple events can be combined to a single event through chip level CIC. However, an event can be mapped only to a single event output from the chip level CIC. The chip level CIC also allows the software to trigger system events through memory writes. The broadcast events to C66x CorePacs can be used for synchronization among multiple cores, inter-processor communication purposes, etc. For more details on the CIC features, please refer to the *Chip Interrupt Controller (CIC) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

Note—Modules such as MPU, Tracer, and BOOT_CFG have level interrupts and an EOI handshaking interface. The EOI value is 0 for MPU, Tracer, and BOOT_CFG.

Figure 7-25 shows the C6654 interrupt topology.

Figure 7-25 TMS320C6654 Interrupt Topology

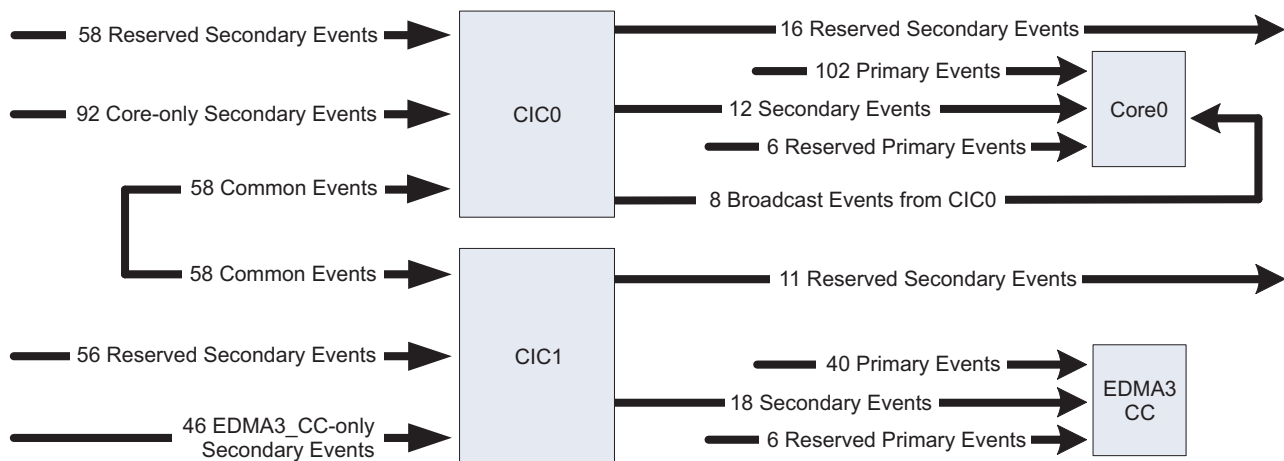

Table 7-33 shows the mapping of system events. For more information on the Interrupt Controller, see the C66x CorePac User Guide in “[Related Documentation from Texas Instruments](#)” on page 64.

Table 7-33 TMS320C6654 System Event Mapping — C66x CorePac Primary Interrupts (Part 4 of 4)

Event Number	Interrupt Event	Description
126	EMC_CMPA	EMC CPU memory protection fault event
127	EMC_BUSERR	EMC bus error interrupt
End of Table 7-33		

- 1 CorePac[n] will receive TETBFULLINTn, TETBFLINTn, TETBACQINTn, TETBOVFLINTn, and TETBUNFLINTn
- 2 CorePac[n] will receive MSMC_mpf_errorn.
- 3 CorePac[n] will receive SEMINTn and SEMERRn.
- 4 CorePac[n] will receive PCIExpress_MSI_INTn.
- 5 n is core number.
- 6 CorePac[n] will receive TINTLn and TINTHn.
- 7 CorePac[n] will receive MACINTn/MACRXINTn/MACTXINTn/MACTRESHn
- 8 CorePac[n] will receive GPINTn.

Table 7-34 CIC0 Event Inputs (Secondary Interrupts for C66x CorePacs) (Part 1 of 6)

Input Event# on CIC	System Interrupt	Description
0	GPINT16	GPIO interrupt
1	GPINT17	GPIO interrupt
2	GPINT18	GPIO interrupt
3	GPINT19	GPIO interrupt
4	GPINT20	GPIO interrupt
5	GPINT21	GPIO interrupt
6	GPINT22	GPIO interrupt

49	PCIExpress_PM_INT	Power management interrupt
50	PCIExpress_Legacy_INTA	Legacy interrupt mode
51	PCIExpress_Legacy_INTB	Legacy interrupt mode
52	PCIExpress_Legacy_CIC	Legacy interrupt mode
53	PCIExpress_Legacy_INTD	Legacy interrupt mode
54	SPIINT0	SPI interrupt0
55	SPIINT1	SPI interrupt1
56	SPIXEVT	Transmit event
57	SPIREVT	Receive event
58	I2CINT	I ² C interrupt
59	I2CREVT	I ² C receive event
60	I2CXEVT	I ² C transmit event
61	Reserved	
62	Reserved	
63	TETBHFULLINT	TETB is half full
64	TETBFULLINT	TETB is full
65	TETBACQINT	Acquisition has been completed
66	TETBOVFLINT	Overflow condition occur
67	TETBUNFLINT	Underflow condition occur
68	SEMINT2	Semaphore interrupt
69	SEMINT3	Semaphore interrupt
70	SEMERR2	Semaphore interrupt
71	SEMERR3	Semaphore interrupt
72	Reserved	
73	Tracer_core_0_INTD	Tracer sliding time window interrupt for individual core
74	Reserved	
75	Reserved	

Table 7-34 C1C0 Event Inputs (Secondary Interrupts for C66x CorePacs) (Part 3 of 6)

Input Event# on CIC	System Interrupt	Description
76	Reserved	
77	Tracer_DDR_INTD	Tracer sliding time window interrupt for DDR3 EMIF1
78	Tracer_MSMC_0_INTD	Tracer sliding time window interrupt for MSMC SRAM bank0
79	Tracer_MSMC_1_INTD	Tracer sliding time window interrupt for MSMC SRAM bank1
80	Tracer_MSMC_2_INTD	Tracer sliding time window interrupt for MSMC SRAM bank2
81	Tracer_MSMC_3_INTD	Tracer sliding time window interrupt for MSMC SRAM bank3
81	Tracer_CFG_INTD	Tracer sliding time window interrupt for CFG0 TeraNet
82	Tracer_QM_CFG_INTD	Tracer sliding time window interrupt for QM_SS CFG
84	Tracer_QM_DMA_INTD	Tracer sliding time window interrupt for QM_SS slave
85	Tracer_SEM_INTD	Tracer sliding time window interrupt for semaphore
86	PSC_ALLINT	Power/sleep controller interrupt
87	Reserved	
88	BOOTCFG_INTD	Chip-level MMR error register
89	po_vcon_smperr_intr	SmartReflex VolCon error status
90	MPU0_INTD (MPU0_ADDR_ERR_INT and MPU0_PROT_ERR_INT combined)	MPU0 addressing violation interrupt and protection violation interrupt.
91	Reserved	
92	MPU1_INTD (MPU1_ADDR_ERR_INT and MPU1_PROT_ERR_INT combined)	MPU1 addressing violation interrupt and protection violation interrupt.
93	Reserved	
94	MPU2_INTD (MPU2_ADDR_ERR_INT and MPU2_PROT_ERR_INT combined)	MPU2 addressing violation interrupt and protection violation interrupt.
95	Reserved	
96	MPU3_INTD (MPU3_ADDR_ERR_INT and MPU3_PROT_ERR_INT combined)	MPU3 addressing violation interrupt and protection violation interrupt.
97	Reserved

Table 7-34 C1C0 Event Inputs (Secondary Interrupts for C66x CorePacs) (Part 5 of 6)

Input Event# on CIC	System Interrupt	Description
161	MSMC_mpf_error3	Memory protection fault indicators for each system master PrivID
162	TINT7L	Timer7 interrupt low
163	TINT7H	Timer7interrupt high
164	UARTINT_A	UART_0 interrupt
165	URXEVT_A	UART_0 interrupt
166	UTXEVT_A	UART_0 interrupt
167	EASYNCERR	EMIF16 error interrupt
168	Tracer_EMIF16	Tracer sliding time window interrupt for EMIF16
169	Reserved	
170	MSMC_mpf_error4	Memory protection fault indicators for each system master PrivID
171	MSMC_mpf_error5	Memory protection fault indicators for each system master PrivID
172	MSMC_mpf_error6	Memory protection fault indicators for each system master PrivID
173	MSMC_mpf_error7	Memory protection fault indicators for each system master PrivID
174	MPU4_INTD (MPU4_ADDR_ERR_INT and MPU4_PROT_ERR_INT combined)	MPU4 addressing violation interrupt and protection violation interrupt.
175	QM_INT_PASS_TXQ_PEND_671	Queue manager pend event
176	QM_INT_PKTDMA_0	QM interrupt for CDMA starvation
177	QM_INT_PKTDMA_1	QM interrupt for CDMA starvation
178	Reserved	
179	Reserved	
180	Reserved	
181	SmartReflex_intrreq0	SmartReflex sensor interrupt
182	SmartReflex_intrreq1	SmartReflex sensor interrupt
183	SmartReflex_intrreq2	SmartReflex sensor interrupt
184	SmartReflex_intrreq3	SmartReflex sensor interrupt
185	VPNoSMPSAck	VPVOLTUPDATE has been asserted but SMPS has not been responded to in a defined time interval
186	VPEqValue	$\overline{\text{SRSINTERUPT}}$ is asserted, but the new voltage is not different from the current SMPS voltage
187	VPMaVdd	The new voltage required is equal to or greater than MaxVdd.
188	VPMiVdd	The new voltage required is equal to or less than MinVdd.
189	VPINIDLE	Indicating that the FSM of voltage processor is in idle.
190	VPOPPChangeDone	Indicating that the average frequency error is within the desired limit.
191	Reserved	
192	MACINT4	EMAC interrupt
193	MACRXINT4	EMAC interrupt
194	MACTXINT4	EMAC interrupt
195	MACTRESH4	EMAC interrupt
196	MACINT5	EMAC interrupt
197	MACRXINT5	EMAC interrupt
198	MACTXINT5	EMAC interrupt

7.8.2 CIC Registers

This section includes the offsets for CIC registers. The base addresses for interrupt control registers are CIC0 - 0x0260 0000 and CIC1 - 0x0260 4000.

7.8.2.1 CIC0 Register Map

Table 7-36 CIC0 Register (Part 1 of 3)

Address Offset	Register Mnemonic	Register Name
0x0	REVISION_REG	Revision Register
0x4	CONTROL_REG	Control Register
0xc	HOST_CONTROL_REG	Host Control Register
0x10	GLOBAL_ENABLE_HINT_REG	Global Host Int Enable Register

End of Table 7-38				

7.8.4 $\overline{\text{NMI}}$ and $\overline{\text{LRESET}}$

Non-maskable interrupts ($\overline{\text{NMI}}$) can be generated by chip-level registers and the $\overline{\text{LRESET}}$ can be generated by software writing into LPSC registers. $\overline{\text{LRESET}}$ and $\overline{\text{NMI}}$ can also be asserted by device pins or watchdog timers. One $\overline{\text{NMI}}$ pin and one $\overline{\text{LRESET}}$ pin are shared by all CorePacs on the device. The CORESEL[3:0] pins can be configured to select between the CorePacs available as shown in [Table 7-39](#).

Table 7-39 $\overline{\text{LRESET}}$ and $\overline{\text{NMI}}$ Decoding (Part 1 of 2)

CORESEL[1:0] Pin Input	$\overline{\text{LRESET}}$ Pin Input	$\overline{\text{NMI}}$ Pin Input	$\overline{\text{LRESETNMIEN}}$ Pin Input	Reset Mux Block Output
XX	X	X	1	No local reset or $\overline{\text{NMI}}$ assertion.
00	0	X	0	Assert local reset to CorePac 0
01	0	X	0	Reserved

Table 7-39 LRESET and NMI Decoding (Part 2 of 2)

CORESEL[1:0] Pin Input	LRESET Pin Input	NMI Pin Input	LRESETNMIEN Pin Input	Reset Mux Block Output
1x	0	X	0	Assert local reset to all CorePacs
00	1	1	0	De-assert local reset & NMI to CorePac 0
01	1	1	0	Reserved
1x	1	1	0	De-assert local reset & NMI to all CorePacs
00	1	0	0	Assert NMI to CorePac 0
01	1	0	0	Reserved
1x	1	0	0	Assert NMI to all CorePacs

End of Table 7-39

7.8.5 External Interrupts Electrical Data/Timing

Table 7-40 NMI and Local Reset Timing Requirements ⁽¹⁾
(see Figure 7-26)

No.		Min	Max	Unit
1	tsu(LRESET-LRESETNMIENL) Setup Time - LRESET valid before LRESETNMIEN low	12*P		ns
1	tsu(NMI-LRESETNMIENL) Setup Time - NMI valid before LRESETNMIEN low	12*P		ns
1	tsu(CORESELn-LRESETNMIENL) Setup Time - CORESEL[2:0] valid before LRESETNMIEN low	12*P		ns
2	th(LRESETNMIENL-LRESET) Hold Time - LRESET valid after LRESETNMIEN high	12*P		ns
2	th(LRESETNMIENL-NMI) Hold Time - NMI valid after LRESETNMIEN high	12*P		ns
2	th(LRESETNMIENL-CORESELn) Hold Time - CORESEL[2:0] valid after LRESETNMIEN high	12*P		ns
3	tw(LRESETNMIEN) Pulse Width - LRESETNMIEN low width	12*P		ns

End of Table 7-40

1 P = 1/SYSCLK1 clock frequency in ns.

Figure 7-26 NMI and Local Reset Timing

7.9 Memory Protection Unit (MPU)

The C6654 supports five MPUs:

- One MPU is used to protect main CORE/3 CFG TeraNet (CFG space of all slave devices on the TeraNet is protected by the MPU).
- Two MPUs are used for QM_SS (one for the DATA PORT port and the other is for the CFG PORT port).
- One MPU is used for Semaphore.
- One MPU is used for EMIF16

This section contains MPU register map and details of device-specific MPU registers only. For MPU features and details of generic MPU registers, see the *Memory Protection Unit (MPU) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

The following tables show the configuration of each MPU and the memory regions protected by each MPU.

Table 7-41 MPU Default Configuration

Setting	MPU0 Main CFG TeraNet	MPU1 (QM_SS DATA PORT)	MPU2 (QM_SS CFG PORT)	MPU3 Semaphore	MPU4 EMIF16
Default permission	Assume allowed	Assume allowed	Assume allowed	Assume allowed	Assume allowed
Number of allowed IDs supported	16	16	16	16	16
Number of programmable ranges supported	16	5	16	1	16
Compare width	1KB granularity	1KB granularity	1KB granularity	1KB granularity	1KB granularity
End of Table 7-41					

Table 7-42 MPU Memory Regions

	Memory Protection	Start Address	End Address
MPU0	Main CFG TeraNet	0x01D00000	0x026203FF
MPU1	QM_SS DATA PORT	0x34000000	0x340BFFFF
MPU2	QM_SS CFG PORT	0x02A00000	0x02ABFFFF
MPU3	Semaphore	0x02640000	0x026407FF
MPU4	EMIF16	0x70000000	0x7FFFFFFF

[Table 7-43](#) shows the privilege ID of each CORE and every mastering peripheral. [Table 7-43](#) also shows the privilege level (supervisor vs. user), security level (secure vs. non-secure), and access type (instruction read vs. data/DMA read or write) of each master on the device. In some cases, a particular setting depends on software being executed at the time of the access or the configuration of the master peripheral.

Table 7-43 Privilege ID Settings (Part 1 of 2)

Privilege ID	Master	Privilege Level	Security Level	Access Type
0	CorePac0	SW dependant, driven by MSMC	SW dependant	DMA
1	Reserved			
2	Reserved			
3	Reserved			
4	Reserved			
5	Reserved			
6	uPP	User	Non-secure	DMA
7	EMAC	User	Non-secure	DMA

Table 7-43 Privilege ID Settings (Part 2 of 2)

Privilege ID	Master	Privilege Level	Security Level	Access Type
8	QM_PKTDMA	User	Non-secure	DMA
9	Reserved			
10	QM_second	User	Non-secure	DMA
11	PCle	Supervisor	Non-secure	DMA
12	DAP	Driven by debug_SS	Driven by debug_SS	DMA
13	Reserved			
14	Reserved			
15	Reserved			

End of Table 7-43

Table 7-44 shows the master ID of each CorePac and every mastering peripheral. Master IDs are used to determine allowed connections between masters and slaves. Unlike privilege IDs, which can be shared across different masters, master IDs are unique to each master.

End of Table 7-44	

1 Some of the PKTDMA-based peripherals require multiple master IDs. QMS_PKT DMA is assigned with 88,89,90,91, but only 88-89 are actually used. There are two master ID values are assigned for the QM_second master port, one master ID for external linking RAM and the other one for the PDSP/MCDM accesses.

2 The master ID for MSMC is for the transactions initiated by MSMC internally and sent to the DDR.

3 All Tracers are set to the same master ID and bit 7 of the master ID needs to be 1.

7.9.1 MPU Registers

This section includes the offsets for MPU registers and definitions for device specific MPU registers.

7.9.1.2 Device-Specific MPU Registers

7.9.1.2.1 Configuration Register (CONFIG)

The Configuration Register (CONFIG) contains the configuration value of the MPU.

Figure 7-27 Configuration Register (CONFIG)

		31	24	23	20	19	16	15	12	11	1	0
		ADDR_WIDTH		NUM_FIXED		NUM_PROG		NUM_AIDS		Reserved		ASSUME_ALLOWED
Reset Values	MPU0	R-0		R-0		R-16		R-16		R-0		R-1
	MPU1	R-0		R-0		R-5		R-16		R-0		R-1
	MPU2	R-0		R-0		R-16		R-16		R-0		R-1
	MPU3	R-0		R-0		R-1		R-16		R-0		R-1
	MPU4	R-0		R-0		R-16		R-16		R-0		R-1

Legend: R = Read only; -n = value after reset

Table 7-50 Configuration Register (CONFIG) Field Descriptions

Bit	Field	Description
31 – 24	ADDR_WIDTH	Address alignment for range checking 0 = 1KB alignment 6 = 64KB alignment
23 – 20	NUM_FIXED	Number of fixed address ranges
19 – 16	NUM_PROG	Number of programmable address ranges
15 – 12	NUM_AIDS	Number of supported AIDs
11 – 1	Reserved	Reserved. These bits will always reads as 0.
0	ASSUME_ALLOWED	Assume allowed bit. When an address is not covered by any MPU protection range, this bit determines whether the transfer is assumed to be allowed or not. 0 = Assume disallowed 1 = Assume allowed

7.9.2 MPU Programmable Range Registers

7.9.2.1 Programmable Range *n* Start Address Register (PROG_{*n*}_MPSAR)

The Programmable Address Start Register holds the start address for the range. This register is writeable by a supervisor entity only. If NS = 0 (non-secure mode) in the associated MPPA register, then the register is also writeable only by a secure entity.

The start address must be aligned on a page boundary. The size of the page is 1K byte. The size of the page determines the width of the address field in MPSAR and MPEAR.

Figure 7-28 Programmable Range *n* Start Address Register (PROG_{*n*}_MPSAR)

Legend: R = Read only; R/W = Read/Write

Table 7-51 Programmable Range *n* Start Address Register (PROG_{*n*}_MPSAR) Field Descriptions

Bit	Field	Description
31 – 10	START_ADDR	Start address for range <i>n</i> .
9 – 0	Reserved	Reserved and these bits always read as 0.
End of Table 7-51

7.9.2.2 Programmable Range *n* End Address Register (PROG_{*n*}_MPEAR)

The Programmable Address End Register holds the end address for the range. This register is writable by a supervisor entity only. If NS = 0 (non-secure mode) in the associated MPPA register then the register is also writable only by a secure entity.

The end address must be aligned on a page boundary. The size of the page depends on the MPU number. The page size for MPU1 is 1K byte and for MPU2 it is 64K bytes. The size of the page determines the width of the address field in MPSAR and MPEAR

7.9.2.3 Programmable Range *n* Memory Protection Page Attribute Register (PROG_{*n*}_MPPA)

The Programmable Address Memory Protection Page Attribute Register holds the permissions for the region. This register is writeable only by a non-debug supervisor entity. If NS = 0 (secure mode) then the register is also only writeable by a non-debug secure entity. The NS bit is writeable only by a non-debug secure entity. For debug accesses the register is writeable only when NS = 1 or EMU = 1.

7.10 DDR3 Memory Controller

The 32-bit DDR3 Memory Controller bus of the TMS320C6654 is used to interface to JEDEC-standard-compliant DDR3 SDRAM devices. The DDR3 external bus interfaces only to DDR3 SDRAM devices; it does not share the bus with any other types of peripherals.

7.10.1 DDR3 Memory Controller Device-Specific Information

The TMS320C6654 includes one 32-bit wide 1.5-V DDR3 SDRAM EMIF interface. The DDR3 interface can operate at 800 Mega transfers per second (MTS) and 1033 MTS.

Due to the complicated nature of the interface, a limited number of topologies will be supported to provide a 16-bit or 32-bit interface.

The DDR3 electrical requirements are fully specified in the DDR Jedec Specification JESD79-3C. Standard DDR3 SDRAMs are available in 8- and 16-bit versions, allowing for the following bank topologies to be supported by the interface:

- 36-bit: Three 16-bit SDRAMs (including 4 bits of ECC)
- 36-bit: Five 8-bit SDRAMs (including 4 bits of ECC)
- 32-bit: Two 16-bit SDRAMs
- 32-bit: Four 8-bit SDRAMs
- 16-bit: One 16-bit SDRAM
- 16-bit: Two 8-bit SDRAM

The approach to specifying interface timing for the DDR3 memory bus is different than on other interfaces such as I²C or SPI. For these other interfaces, the device timing was specified in terms of data manual specifications and I/O buffer information specification (IBIS) models. For the DDR3 memory bus, the approach is to specify compatible DDR3 devices and provide the printed circuit board (PCB) solution and guidelines directly to the user.

A race condition may exist when certain masters write data to the DDR3 memory controller. For example, if master A passes a software message via a buffer in external memory and does not wait for an indication that the write completes, before signaling to master B that the message is ready, when master B attempts to read the software message, then the master B read may bypass the master A write and, thus, master B may read stale data and, therefore, receive an incorrect message.

Some master peripherals (e.g., EDMA3 transfer controllers with TCCMOD=0) will always wait for the write to complete before signaling an interrupt to the system, thus avoiding this race condition. For masters that do not have a hardware specification of write-read ordering, it may be necessary to specify data ordering via software.

If master A does not wait for indication that a write is complete, it must perform the following workaround:

1. Perform the required write to DDR3 memory space.
2. Perform a dummy write to the DDR3 memory controller module ID and revision register.
3. Perform a dummy read from the DDR3 memory controller module ID and revision register.
4. Indicate to master B that the data is ready to be read after completion of the read in step 3. The completion of the read in step 3 ensures that the previous write was done.

7.10.2 DDR3 Memory Controller Electrical Data/Timing

The *KeyStone DSP DDR3 Implementation Guidelines* in “[Related Documentation from Texas Instruments](#)” on page 64 specifies a complete DDR3 interface solution as well as a list of compatible DDR3 devices. The DDR3 electrical requirements are fully specified in the DDR3 Jedec Specification JESD79-3C. TI has performed the simulation and system characterization to ensure all DDR3 interface timings in this solution are met; therefore, no electrical data/timing information is supplied here for this interface.

Note—TI supports *only* designs that follow the board design guidelines outlined in the application report.

7.11 I²C Peripheral

The inter-integrated circuit (I²C) module provides an interface between DSP and other devices compliant with Philips Semiconductors Inter-IC bus (I²C bus) specification version 2.1 and connected by way of an I²C bus. External components attached to this 2-wire serial bus can transmit/receive up to 8-bit data to/from the DSP through the I²C module.

7.11.1 I²C Device-Specific Information

The TMS320C6654 device includes an I²C peripheral module.

Note—When using the I²C module, ensure there are external pullup resistors on the SDA and SCL pins.

The I²C modules on the C6654 may be used by the DSP to control local peripheral ICs (DACs, ADCs, etc.) or may be used to communicate with other controllers in a system or to implement a user interface.

The I²C port is compatible with Philips I²C specification revision 2.1 (January 2000) and supports:

- Fast mode up to 400 Kbps (no fail-safe I/O buffers)
- Noise filter to remove noise 50 ns or less
- 7-bit and 10-bit device addressing modes
- Multi-master (transmit/receive) and slave (transmit/receive) functionality
- Events: DMA, interrupt, or polling
- Slew-rate limited open-drain output buffers

Figure 7-31 shows a block diagram of the I²C module.

7.11.3 I²C Electrical Data/Timing

7.11.3.1 Inter-Integrated Circuits (I²C) Timing

Table 7-58 I²C Timing Requirements ⁽¹⁾

(see Figure 7-32)

No.			Standard Mode		Fast Mode		Units
			Min	Max	Min	Max	
1	t _{c(SCL)}	Cycle time, SCL	10		2.5		μs
2	t _{su(SCLH-SDAL)}	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6		μs
3	t _{h(SDAL-SCLL)}	Hold time, SCL low after SDA low (for a START and a repeated START condition)	4		0.6		μs
4	t _{w(SCLL)}	Pulse duration, SCL low	4.7		1.3		μs
5	t _{w(SCLH)}	Pulse duration, SCL high	4		0.6		μs
6	t _{su(SDAV-SCLH)}	Setup time, SDA valid before SCL high	250		100 ⁽²⁾		ns
7	t _{h(SCLL-SDAV)}	Hold time, SDA valid after SCL low (For I ² C bus devices)	0 ⁽³⁾	3.45	0 ⁽³⁾	0.9 ⁽⁴⁾	μs
8	t _{w(SDAH)}	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		μs
9	t _{r(SDA)}	Rise time, SDA		1000	20 + 0.1C _b ⁽⁵⁾	300	ns
10	t _{r(SCL)}	Rise time, SCL		1000	20 + 0.1C _b ⁽⁵⁾	300	ns
11	t _{f(SDA)}	Fall time, SDA		300	20 + 0.1C _b ⁽⁵⁾	300	ns
12	t _{f(SCL)}	Fall time, SCL		300	20 + 0.1C _b ⁽⁵⁾	300	ns
13	t _{su(SCLH-SDAH)}	Setup time, SCL high before SDA high (for STOP condition)	4		0.6		μs
14	t _{w(SP)}	Pulse duration, spike (must be suppressed)			0	50	ns
15	C _b ⁽⁵⁾	Capacitive load for each bus line		400		400	pF
End of Table 7-58							

1 The I²C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down

2 A Fast-mode I²C-bus™ device can be used in a Standard-mode I²C-bus™ system, but the requirement t_{su(SDA-SCLH)} ≥ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t_r max + t_{su(SDA-SCLH)} = 1000 + 250 = 1250 ns (according to the Standard-mode I²C-Bus Specification) before the SCL line is released.

3 A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.

4 The maximum t_{h(SDA-SCLL)} has only to be met if the device does not stretch the low period [t_{w(SCLL)}] of the SCL signal.

5 C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

Figure 7-32 I²C Receive Timings

Figure 7-33 I²C Transmit Timings

7.12 SPI Peripheral

The serial peripheral interconnect (SPI) module provides an interface between the DSP and other SPI-compliant devices. The primary intent of this interface is to allow for connection to an SPI ROM for boot. The SPI module on the C6654 is supported only in master mode. Additional chip-level components can also be included, such as temperature sensors or an I/O expander.

7.13 UART Peripheral

The universal asynchronous receiver/transmitter (UART) module provides an interface between the DSP and a UART terminal interface or other UART-based peripheral. The UART is based on the industry standard TL16C550 asynchronous communications element, which, in turn, is a functional upgrade of the TL16C450. Functionally similar to the TL16C450 on power up (single character or TL16C450 mode), the UART can be placed in an alternate FIFO (TL16C550) mode. This relieves the DSP of excessive software overhead by buffering received and transmitted characters. The receiver and transmitter FIFOs store up to 16 bytes including three additional bits of error status per byte for the receiver FIFO.

The UART performs serial-to-parallel conversions on data received from a peripheral device and parallel-to-serial conversion on data received from the DSP. The DSP can read the UART status at any time. The UART includes control capability and a processor interrupt system that can be tailored to minimize software management of the communications link. For more information on UART, see the *Universal Asynchronous Receiver/Transmitter (UART) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

7.14 PCIe Peripheral

The two-lane PCI express (PCIe) module on the device provides an interface between the DSP and other PCIe-compliant devices. The PCI Express module provides low-pin-count, high-reliability, and high-speed data transfer at rates of 5.0 GBaud per lane on the serial links. For more information, see the *Peripheral Component Interconnect Express (PCIe) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64. The PCIe electrical requirements are fully specified in the PCI Express Base Specification Revision 2.0 of PCI-SIG. TI has performed the simulation and system characterization to ensure all PCIe interface timings in this solution are met; therefore, no electrical data/timing information is supplied here for this interface.

7.15 EMIF16 Peripheral

The EMIF16 module provides an interface between DSP and external memories such as NAND and NOR flash. For more information, see the *External Memory Interface (EMIF16) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

7.15.1 EMIF16 Electrical Data/Timing

Table 7-64 EMIF16 Asynchronous Memory Timing Requirements⁽¹⁾ (Part 1 of 2)
 (see [Figure 7-40](#) and [Figure 7-41](#))

No.			Min	Max	Unit
General Timing					
2	$t_w(\text{WAIT})$	Pulse duration, WAIT assertion and deassertion minimum time		2E	ns
28	$t_d(\text{WAIT-WEH})$	Setup time, WAIT asserted before WE high		4E + 3	ns
14	$t_d(\text{WAIT-OEH})$	Setup time, WAIT asserted before OE high		4E + 3	ns
Read Timing					
3	$t_c(\text{CEL})$	EMIF read cycle time when ew = 0, meaning not in extended wait mode	(RS+RST+RH+3) *E-3	(RS+RST+RH+3) *E+3	ns
3	$t_c(\text{CEL})$	EMIF read cycle time when ew = 1, meaning extended wait mode enabled	(RS+RST+RH+3) *E-3	(RS+RST+RH+3) *E+3	ns
4	$t_{osu}(\text{CEL-OEL})$	Output setup time from CE low to OE low. SS = 0, not in select strobe mode	(RS+1) * E - 3	(RS+1) * E + 3	ns
5	$t_{oh}(\text{OEH-CEH})$	Output hold time from OE high to CE high. SS = 0, not in select strobe mode	(RH+1) * E - 3	(RH+1) * E + 3	ns
4	$t_{osu}(\text{CEL-OEL})$	Output setup time from CE low to OE low in select strobe mode, SS = 1	(RS+1) * E - 3	(RS+1) * E + 3	ns
5	$t_{oh}(\text{OEH-CEH})$	Output hold time from OE high to CE high in select strobe mode, SS = 1	(RH+1) * E - 3	(RH+1) * E + 3	ns
6	$t_{osu}(\text{BAV-OEL})$	Output setup time from BA valid to OE low	(RS+1) * E - 3	(RS+1) * E + 3	ns
7	$t_{oh}(\text{OEH-BAIV})$	Output hold time from OE high to BA invalid	(RH+1) * E - 3	(RH+1) * E + 3	ns
8	$t_{osu}(\text{AV-OEL})$	Output setup time from A valid to OE low	(RS+1) * E - 3	(RS+1) * E + 3	ns
9	$t_{oh}(\text{OEH-AIV})$	Output hold time from OE high to A invalid	(RH+1) * E - 3	(RH+1) * E + 3	ns
10	$t_w(\text{OEL})$	OE active time low, when ew = 0. Extended wait mode is disabled.	(RST+1) * E - 3	(RST+1) * E + 3	ns
10	$t_w(\text{OEL})$	OE active time low, when ew = 1. Extended wait mode is enabled.	(RST+1) * E - 3	(RST+1) * E + 3	ns
11	$t_d(\text{WAITH-OEH})$	Delay time from WAIT deasserted to OE# high		4E + 3	ns
12	$t_{su}(\text{D-OEH})$	Input setup time from D valid to OE high	3		ns
13	$t_h(\text{OEH-D})$	Input hold time from OE high to D invalid	0.5		ns
Write Timing					
15	$t_c(\text{CEL})$	EMIF write cycle time when ew = 0, meaning not in extended wait mode	(WS+WST+WH+ TA+4)*E-3	(WS+WST+WH+ TA+4)*E+3	ns
15	$t_c(\text{CEL})$	EMIF write cycle time when ew = 1, meaning extended wait mode is enabled	(WS+WST+WH+ TA+4)*E-3	(WS+WST+WH+ TA+4)*E+3	ns
16	$t_{osu}(\text{CEL-WEL})$	Output setup time from CE low to WE low. SS = 0, not in select strobe mode	(WS+1) * E - 3		ns
17	$t_{oh}(\text{WEH-CEH})$	Output hold time from WE high to CE high. SS = 0, not in select strobe mode	(WH+1) * E - 3		ns
16	$t_{osu}(\text{CEL-WEL})$	Output setup time from CE low to WE low in select strobe mode, SS = 1	(WS+1) * E - 3		ns
17	$t_{oh}(\text{WEH-CEH})$	Output hold time from WE high to CE high in select strobe mode, SS = 1	(WH+1) * E - 3		ns
18	$t_{osu}(\text{RNW-WEL})$	Output setup time from RNW valid to WE low	(WS+1) * E - 3		ns
19	$t_{oh}(\text{WEH-RNW})$	Output hold time from WE high to RNW invalid	(WH+1) * E - 3		ns
20	$t_{osu}(\text{BAV-WEL})$	Output setup time from BA valid to WE low	(WS+1) * E - 3		ns
21	$t_{oh}(\text{WEH-BAIV})$	Output hold time from WE high to BA invalid	(WH+1) * E - 3		ns
22	$t_{osu}(\text{AV-WEL})$	Output setup time from A valid to WE low	(WS+1) * E - 3		ns
23	$t_{oh}(\text{WEH-AIV})$	Output hold time from WE high to A invalid	(WH+1) * E - 3		ns
24	$t_w(\text{WEL})$	WE active time low, when ew = 0. Extended wait mode is disabled.	(WST+1) * E - 3		ns

Table 7-64 EMIF16 Asynchronous Memory Timing Requirements⁽¹⁾ (Part 2 of 2)
(see Figure 7-40 and Figure 7-41)

No.		Min	Max	Unit
24	$t_w(\overline{WEL})$ WE active time low, when ew = 1. Extended wait mode is enabled.	$(WST+1) * E - 3$		ns
26	$t_{osu}(\overline{DV-WEL})$ Output setup time from D valid to WE low	$(WS+1) * E - 3$		ns
27	$t_{oh}(\overline{WEH-DIV})$ Output hold time from WE high to D invalid	$(WH+1) * E - 3$		ns
25	$t_d(\overline{WAITH-WEH})$ Delay time from WAIT deasserted to WE# high		4E + 3	ns

7.16 Ethernet Media Access Controller (EMAC)

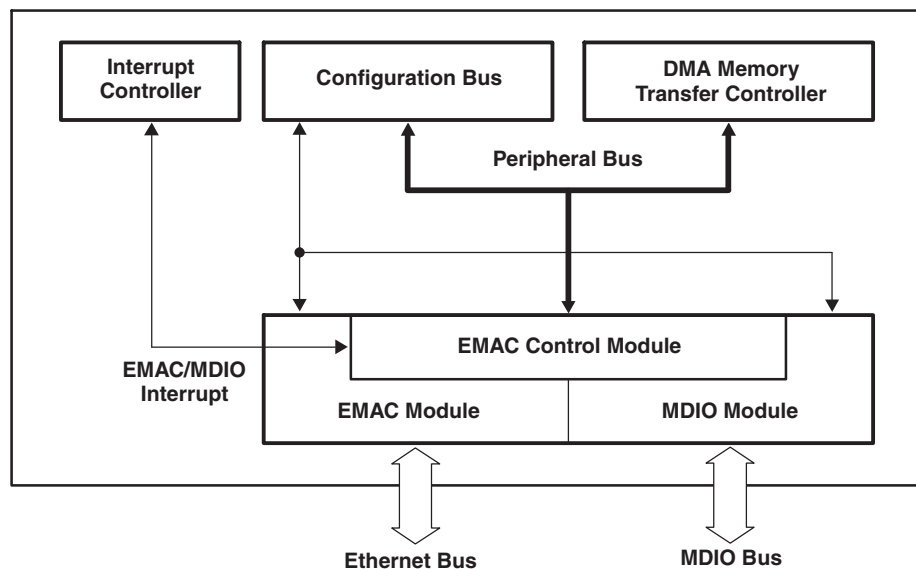

The Ethernet media access controller (EMAC) module provides an efficient interface between the TMS320C6654 DSP core processor and the networked community. The EMAC supports 10Base-T (10 Mbps/second [Mbps]), and 100BaseTX (100 Mbps), in half- or full-duplex mode, and 1000BaseT (1000 Mbps) in full-duplex mode, with hardware flow control and quality-of-service (QOS) support.

The EMAC module conforms to the IEEE 802.3-2002 standard, describing the *Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer* specifications. The IEEE 802.3 standard has also been adopted by ISO/IEC and re-designated as ISO/IEC 8802-3:2000(E).

Deviating from this standard, the EMAC module does not use the transmit coding error signal MTXER. Instead of driving the error pin when an underflow condition occurs on a transmitted frame, the EMAC will intentionally generate an incorrect checksum by inverting the frame CRC, so that the transmitted frame will be detected as an error by the network.

The EMAC control module is the main interface between the device core processor, the MDIO module, and the EMAC module. The relationship between these three components is shown in Figure 7-44. The EMAC control module contains the necessary components to allow the EMAC to make efficient use of device memory, plus it controls device interrupts. The EMAC control module incorporates 8K bytes of internal RAM to hold EMAC buffer descriptors.

Figure 7-44 EMAC, MDIO, and EMAC Control Modules

For more detailed information on the EMAC/MDIO, see *Gigabit Ethernet (GbE) Subsystem for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

7.16.1 EMAC Device-Specific Information

The EMAC module on the device supports Serial Gigabit Media Independent Interface (SGMII). The SGMII interface conforms to version 1.8 of the industry standard specification.

7.16.3 EMAC Electrical Data/Timing (SGMII)

The *Hardware Design Guide for KeyStone Devices* application report specifies a complete EMAC and SGMII interface solution for the C6654 as well as a list of compatible EMAC and SGMII devices. TI has performed the simulation and system characterization to ensure all EMAC and SGMII interface timings in this solution are met; therefore, no electrical data/timing information is supplied here for this interface.

Note—TI supports *only* designs that follow the board design guidelines outlined in the application report.

7.17 Management Data Input/Output (MDIO)

The management data input/output (MDIO) module implements the 802.3 serial management interface to interrogate and control up to 32 Ethernet PHY(s) connected to the device, using a shared two-wire bus. Application software uses the MDIO module to configure the auto-negotiation parameters of each PHY attached to the GbE switch subsystem, retrieve the negotiation results, and configure required parameters in the GbE switch subsystem module for correct operation. The module is designed to allow almost transparent operation of the MDIO interface, with very little maintenance from the core processor. For more information, see the *Gigabit Ethernet (GbE) Subsystem for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

The EMAC control module is the main interface between the device core processor, the MDIO module, and the EMAC module. The relationship between these three components is shown in [Figure 7-44](#).

For more detailed information on the EMAC/MDIO, see *Gigabit Ethernet (GbE) Subsystem for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

7.17.1 MDIO Peripheral Registers

The memory map of the MDIO is shown in [Table 7-70](#).

7.18 Timers

The timers can be used to: time events, count events, generate pulses, interrupt the CPU and send synchronization events to the EDMA3 channel controller.

7.18.1 Timers Device-Specific Information

The TMS320C6654 device has eight 64-bit timers in total. Timer0 is dedicated to the CorePac as a watchdog timer and can also be used as a general-purpose timer. Each of the other seven timers can also be configured as a general-purpose timer only, programmed as a 64-bit timer or as two separate 32-bit timers.

When operating in 64-bit mode, the timer counts either VBUS clock cycles or input (TINPLx) pulses (rising edge) and generates an output pulse/waveform (TOUTLx) plus an internal event (TINTLx) on a software-programmable period.

When operating in 32-bit mode, the timer is split into two independent 32-bit timers. Each timer is made up of two 32-bit counters: a high counter and a low counter. The timer pins, TINPLx and TOUTLx are connected to the low counter. The timer pins, TINPHx and TOUTHx are connected to the high counter.

When operating in watchdog mode, the timer counts down to 0 and generates an event. It is a requirement that software writes to the timer before the count expires, after which the count begins again. If the count ever reaches 0, the timer event output is asserted. Reset initiated by a watchdog timer can be set by programming “[Reset Type Status Register \(RSTYPE\)](#)” on page 133 and the type of reset initiated can set by programming “[Reset Configuration Register \(RSTCFG\)](#)” on page 134. For more information, see the *64-bit Timer (Timer 64) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

7.18.2 Timers Electrical Data/Timing

The tables and figure below describe the timing requirements and switching characteristics of Timer0 through Timer7 peripherals.

Table 7-73 Timer Input Timing Requirements ⁽¹⁾
 (see Figure 7-47)

No.		Min	Max	Unit
1	$t_{w(TINPH)}$ Pulse duration, high	12C		ns
2	$t_{w(TINPL)}$ Pulse duration, low	12C		ns
End of Table 7-73				

¹ C = $1 \div \text{CORECLK(N|P)}$ frequency in ns.

Table 7-74 Timer Output Switching Characteristics ⁽¹⁾
 (see Figure 7-47)

End of Table 7-76

1 Over recommended operating conditions.

2 C = 1 ÷ CORECLK(N|P) frequency in ns.

Figure 7-48 GPIO Timing

7.20 Semaphore2

The device contains an enhanced semaphore module for the management of shared resources of the DSP C66x CorePac. The semaphore enforces atomic accesses to shared chip-level resources so that the read-modify-write sequence is not broken. The semaphore module has a unique interrupt to the CorePac to identify when the core has acquired the resource.

Semaphore resources within the module are not tied to specific hardware resources. It is a software requirement to allocate semaphore resources to the hardware resource(s) to be arbitrated.

The semaphore module supports 8 masters and contains 32 semaphores to be used within the system.

There are two methods of accessing a semaphore resource:

- **Direct Access:** A core directly accesses a semaphore resource. If free, the semaphore will be granted. If not, the semaphore is not granted.
- **Indirect Access:** A core indirectly accesses a semaphore resource by writing it. Once it is free, an interrupt notifies the CPU that it is available.

7.21 Multichannel Buffered Serial Port (McBSP)

The McBSP provides these functions:

- Full-duplex communication
- Double-buffered data registers, which allow a continuous data stream
- Independent framing and clocking for receive and transmit
- Direct interface to industry-standard codecs, analog interface chips (AICs), and other serially connected analog-to-digital (A/D) and digital-to-analog (D/A) devices
- External shift clock or an internal, programmable frequency shift clock for data transfer
- Transmit & receive FIFO buffers allow the McBSP to operate at a higher sample rate by making it more tolerant to DMA latency

If an internal clock source is used, the CLKGDV field of the Sample Rate Generator Register (SRGR) must always be set to a value of 1 or greater.

For more information, see the *Multichannel Buffered Serial Port (McBSP) for KeyStone Devices User Guide* in “[Related Documentation from Texas Instruments](#)” on page 64.

End of Table 7-77			

7.21.2 McBSP Electrical Data/Timing

The following tables assume testing over recommended operating conditions.

7.21.2.1 McBSP Timing

Table 7-78 McBSP Timing Requirements ⁽¹⁾
 (see [Figure 7-49](#))

No.				Min	Max	Unit
2	$t_{c(CKRX)}$	Cycle time, CLKR/X	CLKR/X ext	2P or 20 ^{(2) (3)}		ns
3	$t_{w(CKRX)}$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X ext	P-1 ⁽⁴⁾		ns
5	$t_{su(FRH-CKRL)}$	Setup time, external FSR high before CLKR low	CLKR int	14		ns
			CLKR ext	4		
6	$t_{h(CKRL-FRH)}$	Hold time, external FSR high after CLKR low	CLKR int	6		ns
			CLKR ext	3		
7	$t_{su(DRV-CKRL)}$	Setup time, DR valid before CLKR low	CLKR int	14		ns
			CLKR ext	4		
8	$t_{h(CKRL-DRV)}$	Hold time, DR valid after CLKR low	CLKR int	3		ns
			CLKR ext	3		
10	$t_{su(FXH-CKXL)}$	Setup time, external FSX high before CLKX low	CLKR int	14		ns
			CLKR ext	4		
11	$t_{h(CKXL-FXH)}$	Hold time, external FSX high after CLKX low	CLKR int	6		ns
			CLKR ext	3		
End of Table 7-78						

1 CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

2 P = SYSCLK7 period in ns. For example, when the SYSCLK7 clock domain is running at 166MHz, use 6ns.

3 Use whichever value is greater. Minimum CLKR/X cycle times must be met, even when CLKR/X is generated by an internal clock source. The minimum CLKR/X cycle times are based on internal logic speed; the maximum usable speed may be lower due to EDMA limitations and AC timing requirements

4 This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKR/X) in the reasonable range of 40/60 duty cycle.

TMS320C6654

Fixed and Floating-Point Digital Signal Processor

SPRS841A—August 2012

www.ti.com

Table 7-79 McBSP Switching Characteristics ⁽¹⁾ ⁽²⁾
(see [Figure 7-49](#))

No.	Parameter	Min	Max	Unit	
1	$t_{d(CKSH-CKRXH)}$ Delay time, CLKS high to CLKR/X high for internal CLKR/X generated from CLKS input.	1	14.5	ns	
2	$t_{c(CKRX)}$ Cycle time, CLKR/X	CLKR/X int	2P or 20 ⁽³⁾ ⁽⁴⁾	ns	
3	$t_{w(CKRX)}$ Pulse duration, CLKR/X high or CLKR/X low	CLKR/X int	C - 2 ⁽⁵⁾ C + 2 ⁽⁵⁾	ns	
4	$t_{d(CKRH-FRV)}$ Delay time, CLKR high to internal FSR valid	CLKR int	-4	5.5	ns
4		CLKR int	1	14.5	ns
9	$t_{d(CKXH-FXV)}$ Delay time, CLKX high to internal FSX valid	CLKX int	-4	5.5	ns
		CLKX ext	1	14.5	
12	$t_{dis(CKXH-DXHZ)}$ Disable time, DX Hi-Z following last data bit from CLKX high	CLKX int	-4	7.5	ns
		CLKX ext	1	14.5	
13	$t_{d(CKXH-DXV)}$ Delay time, CLKX high to DX valid	CLKX int	-4 + D1 ⁽⁶⁾	5.5 + D2 ⁽⁶⁾	ns
		CLKX ext	1 + D1 ⁽⁶⁾	14.5 + D2 ⁽⁶⁾	
14	$t_{d(FXH-DXV)}$ Delay time, FSX high to DX valid applies ONLY when in data delay 0 (XDATDLY = 00b) mode	FSX int	-4 + D1 ⁽⁷⁾	5 + D2 ⁽⁷⁾	ns
		FSX ext	-2 + D1 ⁽⁷⁾	14.5 + D2 ⁽⁷⁾	

End of Table 7-79

1 CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

2 Minimum delay times also represent minimum output hold times.

3 P = SYSCLK7 period in ns. For example, when the SYSCLK7 clock domain is running at 166 MHz, use 6 ns.

4 Use whichever value is greater.

5 C = H or L

S = sample rate generator input clock = P if CLKSM = 1 (P = SYSCLK7 period)

S = sample rate generator input clock = P_clks if CLKSM = 0 (P_clks = CLKS period)

If CLKGDV is even:

(1) H = CLKX high pulse width = (CLKGDV/2 + 1) * S

(2) L = CLKX low pulse width = (CLKGDV/2) * S

If CLKGDV is odd:

(1) H = (CLKGDV + 1)/2 * S

(2) L = (CLKGDV + 1)/2 * S

CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the maximum limit.

6 Extra delay from CLKX high to DX valid applies only to the first data bit of a device, if and only if DXENA = 1 in SPCR.

if DXENA = 0, then D1 = D2 = 0

if DXENA = 1, then D1 = 4P, D2 = 8P

7 Extra delay from FSX high to DX valid applies only to the first data bit of a device, if and only if DXENA = 1 in SPCR.

if DXENA = 0, then D1 = D2 = 0

if DXENA = 1, then D1 = 4P, D2 = 8P

Figure 7-49 McBSP Timing

Table 7-80 McBSP Timing Requirements for FSR When GSYNC = 1
(see Figure 7-50)

No.		Min	Max	Unit
1	$t_{su(FRH-CKSH)}$ Setup time, FSR high before CLKS high	4		ns
2	$t_{h(CKSH-FRH)}$ Hold time, FSR high after CLKS high	4		ns

End of Table 7-80

Figure 7-50 FSR Timing When GSYNC = 1

7.22 Universal Parallel Port (uPP)

The universal parallel port (uPP) peripheral is a multichannel, high-speed parallel interface with dedicated data lines and minimal control signals. It is designed to interface cleanly with high-speed analog-to-digital converters (ADCs) or digital-to-analog converters (DACs) with up to 16-bits of data width (per channel). It may also be interconnected with field-programmable gate arrays (FPGAs) or other uPP devices to achieve high-speed digital data transfer. It can operate in receive mode, transmit mode, or duplex mode, in which its individual channels operate in opposite directions.

The uPP peripheral includes an internal DMA controller to maximize throughput and minimize CPU overhead during high-speed data transmission. All uPP transactions use the internal DMA to provide data to or retrieve data from the I/O channels. The DMA controller includes two DMA channels, which typically service separate I/O channels. The uPP peripheral also supports data interleave mode, in which all DMA resources service a single I/O channel. In this mode, only one I/O channel may be used.

The features of the uPP include:

- Programmable data width per channel (from 8 bits to 16 bits inclusive)
- Programmable data justification
 - Right-justify with 0 extend
 - Right-justify with sign extend
 - Left-justify with 0 fill
- Supports multiplexing of interleaved data during SDR transmit
- Optional frame START signal with programmable polarity
- Optional data ENABLE signal with programmable polarity
- Optional synchronization WAIT signal with programmable polarity
- Single Data Rate (SDR) or Double data Rate (DDR, interleaved) interface
 - Supports multiplexing of interleaved data during SDR transmit
 - Supports demultiplexing and multiplexing of interleaved data during DDR transfers

For more information, see the *Universal Parallel Port (uPP) for KeyStone Devices User Guide* in [“Related Documentation from Texas Instruments”](#) on page 64.

7.22.1 uPP Register Descriptions

End of Table 7-81		

Table 7-82 uPP Timing Requirements
(see [Figure 7-51](#), [Figure 7-52](#), [Figure 7-53](#), [Figure 7-54](#))

No.			Min	Max	Unit
1	$t_{c(INCLK)}$	Cycle time, CHn_CLK	SDR mode	13.33	ns
			DDR mode	26.66	
2	$t_{w(INCLKH)}$	Pulse width, CHn_CLK high	SDR mode	5	ns
			DDR mode	10	
3	$t_{w(INCLKL)}$	Pulse width, CHn_CLK low	SDR mode	5	ns
			DDR mode	10	
4	$t_{su(STV-INCLKH)}$	Setup time, CHn_START valid before CHn_CLK high	4		ns
5	$t_{h(INCLKH-STV)}$	Hold time, CHn_START valid after CHn_CLK high	0.8		ns
6	$t_{su(ENV-INCLKH)}$	Setup time, CHn_ENABLE valid before CHn_CLK high	4		ns
7	$t_{h(INCLKH-ENV)}$	Hold time, CHn_ENABLE valid after CHn_CLK high	0.8		ns
8	$t_{su(DV-INCLKH)}$	Setup time, CHn_DATA/XDATA valid before CHn_CLK high	4		ns
9	$t_{h(INCLKH-DV)}$	Hold time, CHn_DATA/XDATA valid after CHn_CLK high	0.8		ns
10	$t_{su(DV-INCLKL)}$	Setup time, CHn_DATA/XDATA valid before CHn_CLK low	4		ns
11	$t_{h(INCLKL-DV)}$	Hold time, CHn_DATA/XDATA valid after CHn_CLK low	0.8		ns
19	$t_{su(WTV-OUTCLKL)}$	Setup time, CHn_WAIT valid before CHn_CLK high	4		ns
20	$t_{h(INCLKL-WTV)}$	Hold time, CHn_WAIT valid after CHn_CLK high	0.8		ns
21	$t_{c(2XTXCLK)}$	Cycle time, 2XTXCLK input clock ⁽¹⁾	6.66		ns
End of Table 7-82					

¹ 2XTXCLK is an alternate transmit clock source that must be at least 2 times the required uPP transmit clock rate (as it is divided down by 2 inside the uPP). 2XTXCLK has no specified skew relationship to the CHn_CLOCK and therefore is not shown in the timing diagram.

Table 7-83 uPP Switching Characteristics
 (see Figure 7-53, Figure 7-54)

No.	Parameter	Min	Max	Unit
12	$t_{c(OUTCLK)}$ Cycle time, CHn_CLK	SDR mode	13.33	ns
		DDR mode	26.66	
13	$t_{w(OUTCLKH)}$ Pulse width, CHn_CLK high	SDR mode	5	ns
		DDR mode	10	
14	$t_{w(OUTCLKL)}$ Pulse width, CHn_CLK low	SDR mode	5	ns
		DDR mode	10	
15	$t_{d(OUTCLKH-STV)}$ Delay time, CHn_START valid after CHn_CLK high	1	11	ns
16	$t_{d(OUTCLKH-ENV)}$ Delay time, CHn_ENABLE valid after CHn_CLK high	1	11	ns
17	$t_{d(OUTCLKH-DV)}$ Delay time, CHn_DATA/XDATA valid after CHn_CLK high	1	11	ns
18	$t_{d(OUTCLKL-DV)}$ Delay time, CHn_DATA/XDATA valid after CHn_CLK low	1	11	ns

7.23 Emulation Features and Capability

7.23.1 Advanced Event Triggering (AET)

The TMS320C6654 device supports advanced event triggering (AET). This capability can be used to debug complex problems as well as understand performance characteristics of user applications. AET provides the following capabilities:

- **Hardware Program Breakpoints:** specify addresses or address ranges that can generate events such as halting the processor or triggering the trace capture.
- **Data Watchpoints:** specify data variable addresses, address ranges, or data values that can generate events such as halting the processor or triggering the trace capture.
- **Counters:** count the occurrence of an event or cycles for performance monitoring.
- **State Sequencing:** allows combinations of hardware program breakpoints and data watchpoints to precisely generate events for complex sequences.

For more information on AET, see the following documents in “[Related Documentation from Texas Instruments](#)” on page 64:

- *Using Advanced Event Triggering to Find and Fix Intermittent Real-Time Bugs* application report
- *Using Advanced Event Triggering to Debug Real-Time Problems in High Speed Embedded Microprocessor Systems* application report

7.23.2 Trace

The C6654 device supports trace. Trace is a debug technology that provides a detailed, historical account of application code execution, timing, and data accesses. Trace collects, compresses, and exports debug information for analysis. Trace works in real-time and does not impact the execution of the system.

For more information on board design guidelines for trace advanced emulation, see the *60-Pin Emulation Header Technical Reference* in “[Related Documentation from Texas Instruments](#)” on page 64.

7.23.2.1 Trace Electrical Data/Timing

Table 7-84 DSP Trace Switching Characteristics ⁽¹⁾
 (see [Figure 7-55](#))

No.	Parameter	Min	Max	Unit
1	$t_w(\text{DPnH})$ Pulse duration, DPn/EMUn high detected at 50% Voh	2.4		ns
1	$t_w(\text{DPnH})90\%$ Pulse duration, DPn/EMUn high detected at 90% Voh	1.5		ns
2	$t_w(\text{DPnL})$ Pulse duration, DPn/EMUn low detected at 50% Voh	2.4		ns
2	$t_w(\text{DPnL})10\%$ Pulse duration, DPn/EMUn low detected at 10% Voh	1.5		ns
3	$t_{sko}(\text{DPn})$ Output skew time, time delay difference between DPn/EMUn pins configured as trace	-1	1	ns
	$t_{skp}(\text{DPn})$ Pulse skew, magnitude of difference between high-to-low (tplh) and low-to-high (tplh) propagation delays.		600	ps
	$t_{\sigma\lambda\delta\pi_o}(\text{DPn})$ Output slew rate DPn/EMUn	3.3		V/ns
End of Table 7-84				

1 Over recommended operating conditions.

3	$t_{sko}(\text{DPn})$ Output skew time, time delay difference between DPn/EMUn pins configured as trace	-1	1	ns
	$t_{skp}(\text{DPn})$ Pulse skew, magnitude of difference between high-to-low (tphl) and low-to-high (tplh) propagation delays.		1	ns
	$t_{\sigma\lambda\delta\pi_o}(\text{DPn})$ Output slew rate DPn/EMUn	3.3		V/ns

End of Table 7-85

1 Over recommended operating conditions.

Figure 7-55 Trace Timing

7.23.3 IEEE 1149.1 JTAG

The JTAG interface is used to support boundary scan and emulation of the device. The boundary scan supported allows for an asynchronous TRST and only the 5 baseline JTAG signals (e.g., no EMU[1:0]) required for boundary scan. Most interfaces on the device follow the Boundary Scan Test Specification (IEEE1149.1), while all of the SerDes (SGMII) support the AC-coupled net test defined in *AC-Coupled Net Test Specification* (IEEE1149.6).

It is expected that all compliant devices are connected through the same JTAG interface, in daisy-chain fashion, in accordance with the specification. The JTAG interface uses 1.8-V LVCMOS buffers, compliant with the *Power Supply Voltage and Interface Standard for Nonterminated Digital Integrated Circuit Specification* (EAI/JESD8-5).

7.23.3.1 IEEE 1149.1 JTAG Compatibility Statement

For maximum reliability, the C6654 DSP includes an internal pulldown (IPD) on the TRST pin to ensure that TRST will always be asserted upon power up and the DSP's internal emulation logic will always be properly initialized when this pin is not routed out. JTAG controllers from Texas Instruments actively drive TRST high. However, some third-party JTAG controllers may not drive TRST high but expect the use of an external pullup resistor on TRST. When using this type of JTAG controller, assert TRST to initialize the DSP after powerup and externally drive TRST high before attempting any emulation or boundary scan operations.

7.23.3.2 JTAG Electrical Data/Timing

Table 7-86 JTAG Test Port Timing Requirements (Part 1 of 2)

(see Figure 7-56)

No.	Parameter	Min	Max	Unit
1	$t_c(\text{TCK})$ Cycle time, TCK	34		ns
1a	$t_w(\text{TCKH})$ Pulse duration, TCK high (40% of t_c)	13.6		ns
1b	$t_w(\text{TCKL})$ Pulse duration, TCK low(40% of t_c)	13.6		ns
3	$t_{su}(\text{TDI-TCK})$ input setup time, TDI valid to TCK high	3.4		ns
3	$t_{su}(\text{TMS-TCK})$ input setup time, TMS valid to TCK high	3.4		ns

A Revision History

Revision A (August 2012)

Added CVDD and SmartReflex voltage parameter in SmartReflex switching table (Page 114)
Updated Thermal Characteristics data (Page 218)
Updated McBSP Timing Requirements table (Page 207)
Removed DDR3 PLL initialization sequence from data manual to the PLL user guide (Page 140)
Added footnote for the initial CVDD voltage 1.1v in Recommended Operating Conditions table (Page 104)
Updated EMIF16 CS[5:2] to CE[3:0] (Page 192)
Added footnote for DDR3 EMIF data in the memory map summary table (Page 25)
Updated Tracer descriptions across the data manual (Page 21)
Added clarification for RESETSTATz input current (Page 105)
Added note for the VCNTLID register that it is available for debug purpose only (Page 117)
Revised the 16-Bit EMIF Features item (Page 13)
Updated th(MDCLKH-MDIO) value from 10 ns to 0 ns in MDIO Timing Requirements table (Page 202)
Updated the description of NAND in the footnote of the memory map summary table (Page 25)
Updated tw(DPnH) and tw(DPnL) descriptions in Trace Switching Characteristics tables (Page 214)
Corrected the tw(RXSTOP15) and tw(RXSTOP2) values in the UART Timing Requirements table (Page 190)
Updated the UPP terminal function type from OZ to IOZ for multiple signal terminals (Page 43)

Revision 0 (First Issue)

B Mechanical Data

B.1 Thermal Data

Table B-1 shows the thermal resistance characteristics for the PBGA - CZH/GZH mechanical package.

Table B-1 Thermal Resistance Characteristics (PBGA Package) [CZH/GZH]

No.		°C/W
1	$R\theta_{JC}$ Junction-to-case	0.284
2	$R\theta_{JB}$ Junction-to-board	4.200
End of Table B-1		

B.2 Packaging Information

The following packaging information reflects the most current released data available for the designated device(s). This data is subject to change without notice and without revision of this document.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TMS320C6654CZH8	ACTIVE	FCBGA	CZH	625	60	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-245C-168 HR	0 to 85	TMS320C6654CZH @2012 TI 850MHZ	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
