

MCP14A0303/4/5

3A Dual MOSFET Driver with Low Threshold Input and Enable

Features

- · AEC-Q100 Qualified
- High-Peak Output Current: 3A (typical)
- · Wide Input Supply Voltage Operating Range:
 - 4.5 to 18V
- Low Shoot-Through/Cross-Conduction Current in Output Stage
- · High Capacitive Load Drive Capability:
 - 1800 pF in 12 ns (typical)
- Short Delay Times: 17 ns (t_{D1}), 21 ns (t_{D2}) (typical)
- Low Supply Current: 620 μA (typical)
- Low-Voltage Threshold Input and Enable with Hysteresis
- Latch-Up Protected: Withstands 500 mA Reverse Current
- · Space-Saving Packages:
 - 8-Lead MSOP
 - 8-Lead SOIC
 - 8-Lead 2 x 3 TDFN

Applications

- · Switch Mode Power Supplies
- · Pulse Transformer Drive
- · Line Drivers
- · Level Translator
- Motor and Solenoid Drive

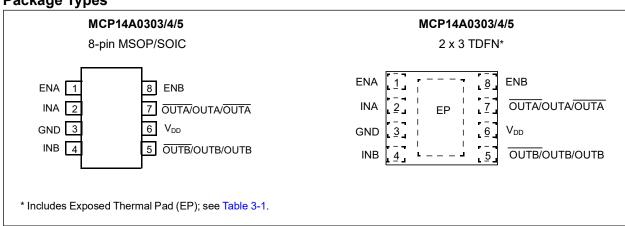

General Description

The MCP14A0303/4/5 devices are high-speed dual MOSFET drivers that are capable of providing up to 3A of peak current while operating from a single 4.5V to 18V supply. There are three output configurations available: dual inverting (MCP14A0303), dual noninverting (MCP14A0304) and complementary (MCP14A0305). These devices feature low shoot-through current, matched rise and fall times, and short propagation delays, which make them ideal for high switching frequency applications.

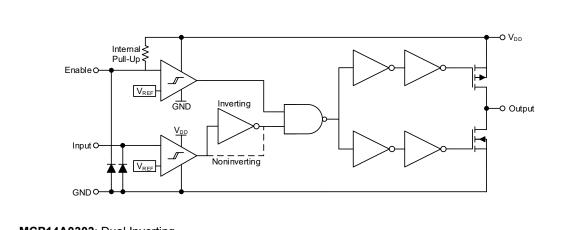

The MCP14A0303/4/5 family of devices offers enhanced control with enable functionality. The active-high Enable pins can be driven low to drive the corresponding outputs of the MCP14A0303/4/5 low, regardless of the status of the input pins. Integrated pull-up resistors allow the user to leave the Enable pins floating for standard operation.

These devices are highly latch-up resistant under any condition within their power and voltage ratings. They can accept up to 500 mA of reverse current being forced back into their outputs without damage or logic upset. All terminals are fully protected against electrostatic discharge (ESD) up to 2 kV (HBM) and 200V (MM).

Package Types

MCP14A0305: Complementary: One Inverting, One Noninverting

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

V _{DD} , Supply Voltage	+20V
V _{IN} , Input Voltage	(V _{DD} + 0.3V) to (GND – 0.3V)
V _{EN} , Enable Voltage	(V _{DD} + 0.3V) to (GND – 0.3V)
Package Power Dissipation (T _A = +50°C)	
8L MSOP	0.63W
8L SOIC	1.00W
8L 2 x 3 TDFN	1.85W
ESD Protection on all pins ⁽¹⁾	
HMB	±4000V
MM	±400V
CDM	±2000V

[†] Notice: Stresses above those listed under "Maximum ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Note 1: Testing was performed per AEC-Q100 standard on the MCP14A0305. ESD CDM was tested on the 8L SOIC package. For additional information please contact your local Microchip sales office.

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLE

MCP14A	MCP14A0303/4/5		Description				
8L 2 x 3 TDFN	8L MSOP/SOIC	Symbol	Description				
1	1	ENA	Enable for Driver A				
2	2	INA	Input for Driver A				
3	3	GND	Device Ground				
4	4	INB	Input for Driver B				
5	5	OUTB/OUTB/OUTB	Push-Pull for Output B				
6	6	V_{DD}	Supply Input Voltage				
7	7	OUTA/OUTA/OUTA	Push-Pull for Output A				
8	8	ENB	Enable for Driver B				
EP	_	EP	Exposed Thermal Pad (GND)				

3.1 Output Pins (OUTA/OUTA/OUTA, OUTB/OUTB/OUTB)

The outputs are CMOS push-pull circuits that are capable of sourcing and sinking 3A of peak current (V_{DD} = 18V). The low output impedance ensures the gate of the external MOSFET stays in the intended state, even during large transients. This output also has a reverse current latch-up rating of 500 mA.

3.2 Device Ground Pin (GND)

GND is the device return pin for the input and output stages. The GND pin should have a low-impedance connection to the bias supply source return. When the capacitive load is discharged, high-peak currents flow through the ground pin.

3.3 Device Enable Pins (ENA, ENB)

The MOSFET driver device enable pins are high-impedance inputs featuring low threshold levels. The enable inputs also have hysteresis between the high and low input levels, allowing them to be driven from slow rising and falling signals, and to provide noise immunity. Driving the enable pins below the threshold disables the corresponding output of the device, pulling OUT/OUT low, regardless of the status of the input pin. Driving the enable pins above the threshold allows normal operation of the OUT/OUT pin based on the status of the input pin. The enable pins utilize internal pull-up resistors, allowing the pins to be left floating for standard driver operation.

3.4 Control Input Pins (INA, INB)

The MOSFET driver control inputs are high-impedance inputs featuring low threshold levels. The inputs also have hysteresis between the high and low input levels, allowing them to be driven from slow rising and falling signals, and to provide noise immunity.

3.5 Supply Input Pin (V_{DD})

 V_{DD} is the bias supply input for the MOSFET driver and has a voltage range of 4.5V to 18V. This input must be decoupled to ground with a local capacitor. This bypass capacitor provides a localized low-impedance path for the peak currents that are provided to the load.

3.6 Exposed Metal Pad Pin (EP)

The exposed metal pad of the TDFN package is internally connected to GND. Therefore, this pad should be connected to a ground plane to aid in heat removal from the package.

4.0 APPLICATION INFORMATION

4.1 General Information

MOSFET drivers are high-speed, high-current devices that are intended to source/sink high-peak currents to charge/discharge the gate capacitance of external MOSFETs or Insulated-Gate Bipolar Transistors (IGBTs). In high-frequency switching power supplies, the Pulse-Width Modulation (PWM) controller may not have the drive capability to directly drive the power MOSFET. A MOSFET driver such as the MCP14A0303/4/5 family can be used to provide additional source/sink current capability.

4.2 MOSFET Driver Timing

The ability of a MOSFET driver to transition from a fully-off state to a fully-on state is characterized by the driver's rise time (t_R), fall time (t_F) and propagation delays (t_{D1} and t_{D2}). Figure 4-1 and Figure 4-2 show the test circuit and timing waveform used to verify the MCP14A0303/4/5 timing.

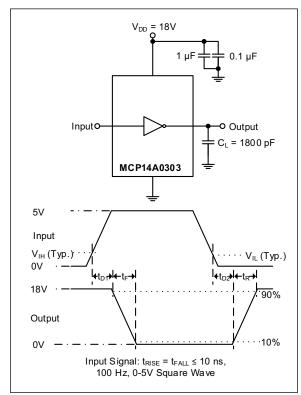

FIGURE 4-1: Inverting Driver Timing Waveform.

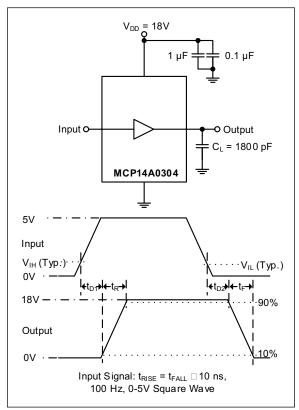

FIGURE 4-2: Noninverting Driver Timing Waveform.

4.3 Enable Function

The enable pins (ENA, ENB) provide additional control of the output pins (OUT). These pins are active-high and are internally pulled up to V_{DD} so that the pins can be left floating to provide standard MOSFET driver operation.

When the enable pin input voltages are above the enable pin high-voltage threshold (V_{EN_H}), the corresponding output is enabled and allowed to react to the status of the input pin. However, when the voltage applied to the enable pins falls below the low threshold voltage (V_{EN_L}), the driver's corresponding output is disabled and does not respond to changes in the status of the input pins. When the driver is disabled, the output is pulled down to a low state. Refer to Table 4-1 for the enable pin logic. The threshold voltage levels for the enable pin are similar to the threshold voltage levels of the input pin and are TTL compatible. Hysteresis is provided to help increase the noise immunity of the enable function, avoiding false triggers of the enable signal during driver switching.

There are propagation delays associated with the driver receiving an enable signal and the output reacting. These propagation delays, t_{D3} and t_{D4} , are graphically represented in Figure 4-3.

TABLE 4-1: ENABLE PIN LOGIC

EN	IN	OUT	OUT
Н	Н	L	Н
Н	L	Н	L
L	Х	L	L

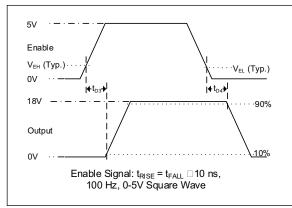

FIGURE 4-3: Enable Timing Waveform.

4.4 Decoupling Capacitors

Careful Printed Circuit Board (PCB) layout and decoupling capacitors are required when using power MOSFET drivers. A large current is required to charge and discharge capacitive loads quickly. For example, approximately 720 mA are needed to charge a 1000 pF load with 18V in 25 ns.

To operate the MOSFET driver over a wide frequency range with low supply impedance, it is recommended to place 1.0 μF and 0.1 μF low ESR ceramic capacitors in parallel between the driver V_{DD} and GND. These capacitors should be placed close to the driver to minimize circuit board parasitics and provide a local source for the required current.

4.5 PCB Layout Considerations

Proper PCB layout is important in high-current, fast-switching circuits to provide proper device operation and robustness of design. Improper component placement may cause errant switching, excessive voltage ringing or circuit latch-up. The PCB trace loop length and inductance should be minimized by the use of ground planes or traces under the MOSFET gate drive signal. Separate analog and power grounds and local driver decoupling should also be used.

Placing a ground plane beneath the MCP14A0303/4/5 devices will help as a radiated noise shield, as well as providing some heat sinking for power dissipated within the device.

4.6 Power Dissipation

The total internal power dissipation in a MOSFET driver is the summation of three separate power dissipation elements, as shown in Equation 4-1.

EQUATION 4-1:

$$P_T = P_L + P_Q + P_{CC}$$

Where:

 P_T = Total power dissipation P_L = Load power dissipation P_Q = Quiescent power dissipation

P_{CC} = Operating power dissipation

4.6.1 CAPACITIVE LOAD DISSIPATION

The power dissipation caused by a capacitive load is a direct function of the frequency, total capacitive load and supply voltage. The power lost in the MOSFET driver for a complete charging and discharging cycle of a MOSFET is shown in Equation 4-2.

EQUATION 4-2:

$$P_L = f \times C_T \times V_{DD}^2$$

Where:

f = Switching frequency

C_T = Total load capacitance

V_{DD} = MOSFET driver supply voltage

4.6.2 QUIESCENT POWER DISSIPATION

The power dissipation associated with the quiescent current draw depends on the state of the Input and Enable pins. See Section 1.0 "Electrical Characteristics" for typical quiescent current draw values in different operating states. The quiescent power dissipation is shown in Equation 4-3.

EQUATION 4-3:

$$P_Q = (I_{QH} \times D + I_{QL} \times (1 - D)) \times V_{DD}$$

Where:

I_{OH} = Quiescent current in the High state

D = Duty cycle

I_{OI} = Quiescent current in the Low state

V_{DD} = MOSFET driver supply voltage

4.6.3 OPERATING POWER DISSIPATION

The operating power dissipation occurs each time the MOSFET driver output transitions because, for a very short period of time, both MOSFETs in the output stage are on simultaneously. This cross-conduction current leads to a power dissipation described in Equation 4-4.

EQUATION 4-4:

$$P_{CC} = V_{DD} \times I_{CO}$$

Where:

I_{CO} = Crossover current

 V_{DD} = MOSFET driver supply voltage

NOTES:

APPENDIX A: REVISION HISTORY

Revision B (April 2023)

- Added Automotive Qualification to Features and examples in Product Identification System.
- Added values for ESD protection to Absolute Maximum Ratings †.
- Updated Section 5.0, Packaging Information.
- Minor text and format changes throughout.

Revision A (June 2018)

· Original Release of this Document.

MCP14A0303/4/5

NOTES:

NOTES:

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not
 mean that we are guaranteeing the product is "unbreakable" Code protection is constantly evolving. Microchip is committed to
 continuously improving the code protection features of our products.

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at https://www.microchip.com/en-us/support/design-help/client-support-services.

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, OR CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
